

DL6 series linear servo driver

User manual

Wuxi Xinje Electric Co., Ltd. Data No.: SL6 01 20241223EN 1.0

Basic explanation

- Thank you for purchasing XJNIE DS5C2 series servo driver products.
- This manual mainly introduces the product information of DS5C2 series servo driver and MS6 series servo motor.
- Before using the product, please read this manual carefully and connect the wires on the premise of fully understanding the contents of the manual.
- Please deliver this manual to the end user.

This manual is suitable for the following users

- Designer of servo system
- Installation and wiring workers
- Commissioning and servo debugging workers
- Maintenance and inspection workers

Get the manual

• Please consult the supplier, agent and office who purchased the product.

Declaration of liability

- Although the contents of the manual have been carefully checked, errors are inevitable, and we cannot guarantee complete consistency.
- We will often check the contents of the manual and make corrections in the subsequent versions.We welcome your valuable comments.
- If there is any change to the contents introduced in the manual, please understand without further notice.

Contact information

- Tel: 400-885-0136
- Fax: 0510-85111290
- Address: No.816, Jianzhu West Road, Binhu District, Wuxi City, Jiangsu Province, China
- Postcode: 214072

WUXI XINJE ELECTRIC CO., LTD. Copyright

Without explicit written permission, this material and its contents shall not be copied, transmitted or used, and the violator shall be liable for the losses caused. All rights provided in the patent license and registration including utility module or design are reserved.

Before using this product, please read this part carefully and operate after fully understanding the use, safety and precautions of the product. Please connect the product correctly on the premise of paying great attention to safety.

The problems that may arise during the use of the product are basically listed in the safety precautions, and all are indicated by the two levels of attention and danger. For other unmentioned matters, please follow the basic electrical operation rules.

When used incorrectly, there may be danger, moderate injury or minor injury, and property loss.

When used incorrectly, it may cause danger, personal casualties or serious injuries as well as serious property losses.

Attention to product confirmation

1. Do not install damaged drives, drives that lack spare parts, or drives whose models do not meet the requirements.

1. Before installing the wiring, please be sure to disconnect the power supply to prevent the risk of electric shock.

2. It is prohibited to use this product in places with water vapor, corrosive gases, flammable gases, and other substances, which may cause electric shock and fire hazards.

3. Do not directly touch the conductive parts of the product, as it may cause misoperation or malfunction.

Wiring precautions

- 1. Please connect the AC power supply correctly to the dedicated power terminal of the drive. Do not connect the output terminals U, V, W of the driver to a three-phase power supply.
- 2. Please connect the ground wire correctly, poor grounding may cause electric shock. Please use cables that meet the relevant wire diameter requirements for grounding treatment.

3. Please tighten the fixing screws of the terminals, otherwise it may cause a fire.

Before wiring the drive, be sure to disconnect all external power sources.

5. Please ensure that the encoder and power cables are in a loose state during wiring, and do not tighten them to avoid cable damage.

Precautions for operation

1. Please pay attention to tuning before performing jogging and trial operation.

2. After connecting the machinery, please set the appropriate parameters before running, otherwise it may cause the machinery to lose control or malfunction.

During operation, do not touch the radiator as there is a risk of burns.

4. Do not change the wiring while it is live, as there is a risk of injury.

5. Do not frequently turn on and off the power supply. If you need to turn on and off the power supply multiple times, please control it to once every 2 minutes.

Maintenance and Inspection

1. Do not touch the inside of the servo drive, otherwise it may cause electric shock.

2. When starting the power supply, it is forbidden to remove the driver panel, otherwise it may cause electric shock.

3. Within 15 minutes of turning off the power, do not touch the wiring terminals, otherwise residual voltage may cause electric shock.

Attention to wiring

1. Please do not pass the power line and control signal line through the same pipeline, and do not tie them together. The power line and control signal line are separated by more than 30 centimeters.

2. For signal cables and encoder differential feedback cables, please use multi-stranded wires and multi-core stranded shielded wires. For wiring length, the longest signal input cable is 3 meters, and the longest encoder differential feedback cable is 20 meters.

►► Confirmation on product arrival

 ie product antres, preuse commin are integrity of the product in the rono wing aspects.			
Items	Notes		
Does the product on arrival match the	Please confirm according to the nameplate of servo motor		
specified model?	and servo unit.		
Is there any damage?	Check the overall appearance, and check for damage or		
	scratches that may have occurred during shipping.		
Are there any loose screws?	Check screws for looseness using a screwdrive.		

After the product arrives, please confirm the integrity of the product in the following aspects.

If any of the above is faulty or incorrect, contact Xinje or an authorized distributor.

1 Product overview

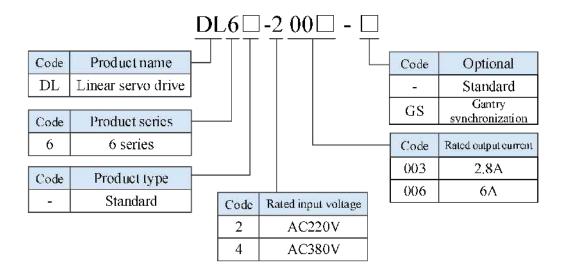

1.1 DL6 linear servo drive product overview

The DL6 is a high-performance servo drive that leverages innovative technology and advanced control algorithms, offering advantages of high speed, high precision, and rapid response for controlling direct-drive linear motors. It currently supports ABZ+HALL, ABZ, and Biss-C encoder control.

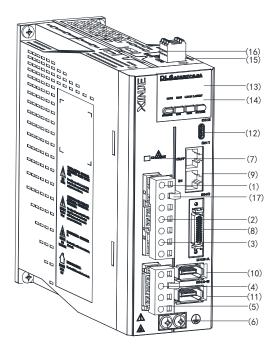

This model is suitable for various applications such as EtherCAT bus and pulse control, providing easy selection options for customers.

With the use of upper computer debugging software, the DL6 linear servo can be plug-and-play debugged, allowing operations such as tuning, motor setup, parameter configuration, curve acquisition, and gain adjustments to be performed in the upper computer software. For specific tuning and motor setup, please refer to Section 5.1 of this manual on motor function settings. For curve acquisition and gain tuning, please refer to Chapter 9 on servo gain adjustments in this manual.

1.1.1 Model naming

1.1.2 Description of each part

The names of each part of the DL6 servo drive are as follows:

No.	Name	Explanation
	L1/L2/L3	Refer to drive nameplate rated voltage level input main
(1)	Main circuit power input	circuit power supply: L1/L2/L3: Single phase/three-phase
	terminal	main circuit power supply
(2)	P+, P- bus terminal	Driver bus terminal
		When using the built-in braking resistor, short-circuit the
	P+, D, C Braking resistor	P+ and D terminals, P+ and C are disconnected.When
(3)	connection terminal	using an external braking resistor, remove the P+ and D
		short-circuit wires and connect the braking resistor to the
		P+ and C terminals
(4)	U, V, W Servo motor power	Connect servo motor U/V/W phase
(+)	terminal	
(5)	PE motor grounding terminal	Connect to the motor grounding terminal and perform
(3)		grounding treatment
		Connect to external ground piles and perform grounding
(6)	Drive grounding terminal	treatment. Connect to the power grounding terminal and
		perform grounding treatment
		Used to indicate that the bus capacitor is in a charged
		state. When the indicator light is on, even if the main
(7)	CHARGE Bus voltage	circuit power is turned off, the internal capacitor of the
(7)	indicator light	servo unit may still have charge. Therefore, do not touch
		the power terminal when the light is on to avoid electric
		shock

(8)	CN0: Input/output control port	26 pins function control signal terminal	
(9)	CN1: EtherCAT port	EtherCAT communication port	
(10)	CN2-A: encoder	Connect to the motor encoder terminal	
(10)	communication port 1		
(11)	CN3-B: encoder	Connect to the motor encoder terminal, ABZ+HALL	
(11)	communication port 2	encoder type interface	
(12)	CN2. USD Type C interface	USB 2.0 communication interface, connected to the servo	
(12)	CN3: USB Type-C interface	upper computer debugging software for communication	
(12)	Deire diester von d	5-digit 8-segment LED digital display, used to display the	
(13)	Drive display panel	operating status and parameter settings of the servo	
	Drive exament status display	Including enable state, error state, EC bus IN network port	
(14)	Drive current status display	physical connection status, EC bus OUT network port	
	light	physical connection status display	
	CN5. STO sofety function	STO function safety terminal, used for application	
(15)	CN5: STO safety function	scenarios of safety functions, external safety function	
	terminal	signal access	
(16)	CN4: gantry synchronization	Connect to another driver to perform gantry	
(16)	interface	synchronization function	
(17)	Wiring auxiliary buckle Installation and wiring assistance for pin terminals		

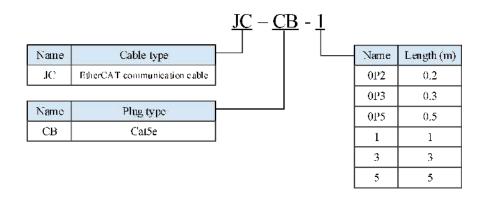

1.1.3 Performance specifiation

Servo unit		DL6 series linear servo drive	
		DL6-200 : single phase/three phase AC200~240V, 50/60Hz	
Input powe	er supply	(If using single-phase 220V power supply, it is necessary to connect to L1	
		and L3, otherwise power failure will affect parameter memory)	
Control mo	ode	IGBT PWM Control Sine Wave Current Drive Method	
	Using	-10~+40 °C	
	temperature		
	Storage	-20~+60 °C Below 90% RH (no condensation)	
	temperature		
Using	Environment		
condition	humidity		
	Vibration	4.9m/s^2	
resistance		4.2005	
	Altitude	Not exceeding 1000m, please reduce the rating when exceeding 1000m	
Annuae		(1% reduction for every 100m higher)	

1.1.4 Electrical specification

Driver model	Driver power (kW)	Continuous output current (A)	Maximum output current (A)	Power input current (A)	Power supply	Cooling method
DL6-2003(-GS)	0.4	2.8	9.8	3	Single phase AC200~240V,	Air cooling
DL6-2006(-GS)	1.0	6	18	9	50/60Hz	Air cooling

1.1.5 EtherCAT communication cable

At present, the length of communication cables is 0.2m, 0.3m, 0.5m, 1m, 3m, 5m, 10m, 20m.

1.2 Selection of braking resistor

When the servo motor is driven by the generator mode, the power returns to the servo amplifier side, which is called regenerative power. The regenerated power is absorbed by charging the smooth capacitor of the servo amplifier. After exceeding the rechargeable energy, the regenerative resistance is used to consume the regenerative power.

- During deceleration operation or deceleration stop period.
- When the external load drives the motor to rotate.

Servo driver model	Braking resistor connection terminal		
	(1) Use the built-in braking resistor and short-circuit the P+ and D terminals,		
	P+ and C are disconnected.		
DL6-200⊓-⊓	(2) When using an external braking resistor for a 1kW driver with a built-in		
	braking resistor, connect the braking resistor to the P+ and C terminals,		
	remove the P+ and D short-circuit wires, P0-25= power value, P0-26=		
	resistance value.		

The following table shows the recommended external braking resistor specifications for each model of driver.

		Minimum	External braking	External braking
Comro duirrou uso dol	Built in braking	resistance value	resistor	resistor
Servo driver model	resistor	(Cannot be less	(Recommended	(Recommended
		than this value)	resistance value)	power value)
DL6-2003-(GS)	/	80Ω	80Ω-100Ω	Above 200W
DL6-2006-(GS)	80W45Ω	35Ω	35Ω-75Ω	Above 800W

- The smaller the resistance value, the faster the discharge, but if it is too small, it is easy to break down the resistance. Therefore, when selecting, try to approach the lower limit as much as possible and not lower than it.
- When wiring, please use high temperature resistant and flame-retardant wires, and be careful not to contact the surface of the braking resistor with the wires.

1.3 Line filter

Line filter is an electronic device mainly used for filtering signals in circuits. Capacitors have a small impedance to high-frequency signals, while inductors have a large impedance to high-frequency signals. By utilizing the characteristics of inductors, capacitors, and other components, circuits are designed to block or allow signals within a specific frequency range to pass through, thereby suppressing electromagnetic interference, improving power quality, protecting equipment, and enhancing system reliability.

The following table shows the recommended line filter specifications for each model of driver.

Servo driver model	Voltage/frequency	Manufacturer Part Number	
		LCR: 055M.80601.00	
DL6-2003-(GS)	DC/AC 250V 50/60Hz	LCR: 092.00623.00	
	50/0011Z	Schaffner: FN2070-6	
		LCR: 0923.01021.00	
DI (200((CS)	DC/AC 250V	LCR: 092.01023.00	
DL6-2006-(GS)	50/60Hz	LCR: 055.81011.00	
		Schaffner: FN2070-10	

- The filter should be installed as close as possible to the driver to prevent capacitance from coupling to other signal lines and cables and generating noise.
- The filter will generate high leakage current, and it must be grounded before connecting to the power supply.
- Do not touch the filter within 10 seconds after turning off the power.

2 Installation of servo system

2.1 Servo driver installation

2.1.1 Installation site

- Please install it in the installation cabinet without sunshine or rain.
- Do not use this product near corrosive and flammable gas environments and combustibles such as hydrogen sulfide, chlorine, ammonia, sulfur, chlorinated gas, acid, alkali, salt, etc.
- Do not install in high temperature, humidity, dust, metal dust environment.
- No vibration place.

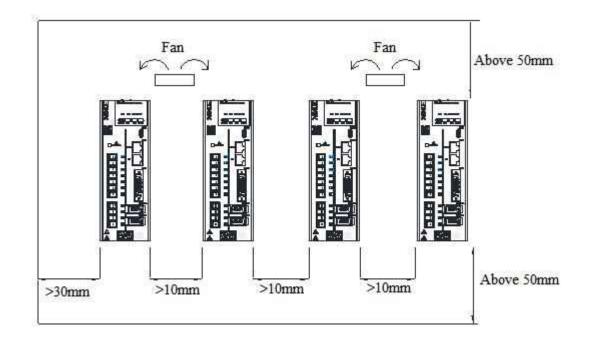

2.1.2 Environment condition

Item	Description
Using ambient	-10~40°C
temperature	
Using ambient	20,000/PH (no condensation)
humidity	20~90%RH (no condensation)
Storage	-20~60°C
temperature	-20~001C
Storage humidity	20~90%RH (no condensation)
Vibration	Not more than 4.9m/s^2
resistance	Not more than 4.9m/s ²
Altitude	Not exceeding 1000m, please reduce the rating when exceeding 1000m
Alliude	(1% reduction for every 100m higher)

2.1.3 Installation standard

Please be sure to follow the installation standards inside the control cabinet shown in the figure below, which apply to situations where multiple servo drives are installed side by side in the control cabinet (hereinafter referred to as "side by side installation").

Taking 1kw and below drives as an example:

■ Side-by-side installation

As shown in the above figure, when installing drives side by side in the installation cabinet:

Drivers of 1kW and below should leave at least 10mm space on both sides horizontally and at least 50mm space on both sides vertically.

In addition, in order to prevent local overheating of the servo drive environment, it is necessary to maintain a uniform temperature inside the control cabinet.

Orientation of servo drive

When installing, please make the front of the servo driver (the actual installation surface of the operator) face the operator and make it perpendicular to the wall. For drives with regenerative resistors at the bottom, please pay attention to the heat dissipation of the mounting surface to avoid overheating and fire.

Cooling

As shown in the figure above, allow sufficient space around each servo drive for cooling by fans or natural convection.

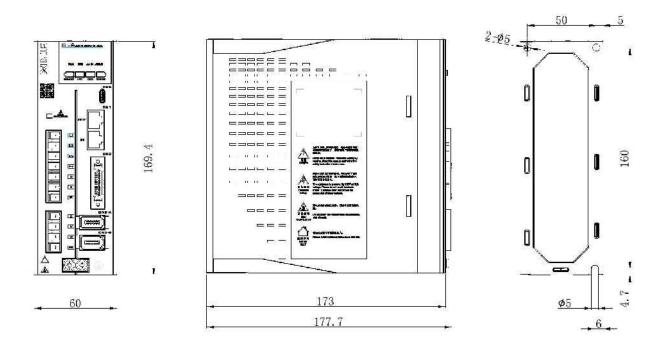

- Environmental conditions in the control panel
 - Servo driver working ambient temperature: -10~40°C.
 - Humidity: Below 90%RH(relative humidity)
 - Vibration: 4.9m/s^2
 - Please do not allow it to freeze or condense.

• In order to ensure the reliability of long-term use, please use it at an ambient temperature lower than 50°C.

2.2 Servo driver dimension

■ DL6-2003/2006(-GS)

Unit: mm

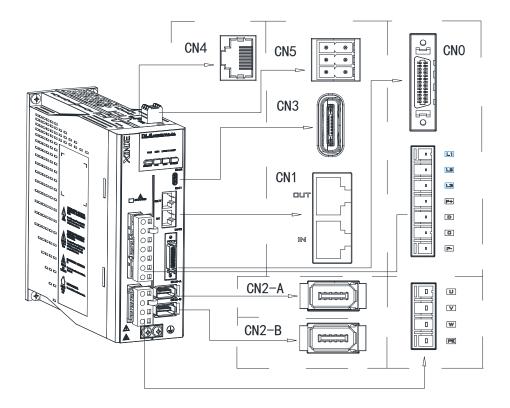

3 Servo system wiring

Precautions for the use of servo drive interface wiring:

- Please do not pass the power cable and signal cable through the same pipeline, and do not tie them together. When wiring, please keep the power cable and signal cable at least 30cm apart.
- For signal cables and encoder (PG) feedback cables, please use multi stranded wires and multi-core twisted overall shielded wires.
- For the wiring length, the maximum length of the instruction input cable is 3m, and the maximum length of the PG feedback cable is 20m.
- Even if the power supply to the driver is disconnected and the panel displays OFF, the internal capacitance of the servo unit will still be stuck with high voltage. Please do not touch the power terminal temporarily (within 10 minutes).
- Do not frequently turn on or off the power supply of the driver. When it is necessary to repeatedly switch on and off the power supply continuously, it is necessary to ensure that the power switch frequency is greater than 2 minutes per time. The servo drive has a large capacitor inside, so when the power is turned on, the internal circuit of the drive will flow a large charging current (charging time of 0.2 seconds). Therefore, if the power supply is frequently switched on and off, it will cause a decrease in the performance of the main circuit components inside the servo drive, affecting the service life of the drive.

3.1 Main circuit terminal

3.1.1 Servo driver terminal layout

Each part name:

- (1): CN3 USB Type-C interface
- (2): CN5 STO terminal
- (3): CN0 input output signal
- (4): CN1 RJ45 port
- (5): CN2-A encoder port
- (6): CN2-B encoder port
- (7): Power supply terminal
- (8): Motor wiring terminal
- (9): CN4 gantry synchronization terminal

3.1.2 Main circuit terminals

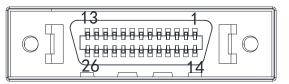

■ DL6-2003/2006(-GS)

According to the order from top to bottom, the main circuit terminal functions are as follows:

		Terminal	Function	Explanation
	LI LI LI P+	L1, L2, L3	Main circuit power input terminal	Single phase/three-phase AC 200-240V, 50/60Hz If single-phase power supply is used, please connect L1/L3, otherwise it will affect parameter memory when power is lost
	2 3 5 E M 0 0		Use built-in braking resistor	Short circuit P+ and D terminals, disconnect P+ and C.
		P+, D, C	Use external braking resistor	Connect the braking resistor to the P+ and C terminals; P0-25=power value, P0-26=resistance value
		P+, P-	Bus terminal	Real time voltage of the busbar can be measured, please be aware of the danger
			Motor connection terminal	Connect to the motor
		Ē	Grounding terminal	The ground wire is on the heat sink. Please confirm good grounding before powering on

3.1.3 CN0, CN1, CN2-A, CN2-B, CN3, CN4, CN5 terminals

3.1.3.1 CN0 terminal explanation

No.	Name	Note	No.	Name	Note
1	+24V	+24V	14	SI3	Normal input terminal 3
2	SI4	Normal input terminal 4	15	SI5	Normal input terminal 5
3	SI6	Normal input terminal 6	16	SI7	Normal input terminal 7
4	СОМ	Output common terminal	17	SO3	Normal output terminal 3
5	SO4	Normal output terminal 4	18	SO1	High speed output terminal 1
6	SO2	High an and autmut terminal 2	19	DO_24V	+24V power supply for high

3.1.3.3 CN2 terminal explanation

■ CN2-A terminal explanation

The arrangement of the CN2-A driver side - encoder socket terminals is as follows:

	No.	Definition	No.	Definition
	1	Power supply +5V	6	Incremental encoder B-
	1		0	Biss-C encoder DATA-
	2	GND	7	Incremental encoder Z+
246810	3	Incremental encoder A+	8	Incremental encoder Z-
		Biss-C encoder CLK+		
		Incremental encoder A-	9	Motor temperature +
		Biss-C encoder CLK-	9	
	5	Incremental encoder B+	10	Motor tomporatura
	5	Biss-C encoder DATA+	10	Motor temperature -

The driver only supports PT100 for detecting motor temperature and cannot detect the type of NTC/PTC thermistor embedded in the motor. Temperature detection can be blocked in the upper computer software.

■ CN2-B terminal explanation

	No.	Definition	No.	Definition
	1	Power supply +5V	6	-
246810	2	GND	7	Rotary encoder A
13579	3	Hall U+	8	Rotary encoder B
	4	Hall V+	9	-
	5	Hall W+	10	-

■ CN2 terminal explanation

Terminal	Connector	Manufacturer PN
CN2	A plug used for plug-in terminal blocks	1394-10P REV 01

3.1.3.5 CN3 terminal explanation (RS232)

	No.	Definition	No.	Definition
	A1	GND	B1	GND
A1 8 4 81	A4	USB-VBUS	B4	USB-VBUS
	A6	USB-D+	B6	USB-D+
A12	A7	USB-D-	B7	USB-D-
A12 B12	A9	USB-VBUS	B9	USB-VBUS
	A12	GND	B12	GND

3.1.3.6 CN4 terminal explanation (gantry synchronization)

Gantry synchronization interface	No.	Name	No.	Name
	1	TX A+	5	-
	2	TX A-	6	RX A-
	3	RX A+	7	-
	4	-	8	-

3.1.3.7 CN5 terminal explanation (STO function)

The terminal arrangement of driver CN5 port is shown below (at the top of the driver), and the safety torque off (STO):

No.	Name	Explanation	No.	Name	Explanation
1	STO2	STO2 circuit input	4	STO1	STO1 circuit input
2	24V	24V output	5	СОМ	Common ground
3	EDM+	EDM output+	6	EDM-	EDM output-

In order to make the debugging process more user-friendly, a power supply voltage (2: 24V) pin has been added. If the STO function is not required, the STO1 and STO2 terminals need to be connected to the 24V terminal.

The maximum allowable cable length between the driver and the safety switch is 30m.

3.2 Classification and Function of Signal Terminals

3.2.1 SI input signal

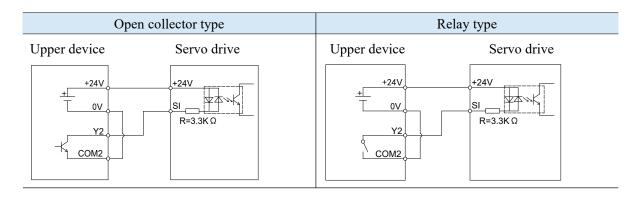

Please use a relay or an open collector transistor circuit to connect. When using relay connection, please select the relay for small current. If the relay is not small current, it will cause bad contact.

Туре	Input terminal	Function
Digital input	SI1~SI7	Multifunctional input signal terminal

Defaulted assignment of input terminals

Terminal	SI1	SI2	SI3	SI4	SI5	SI6	SI7
Function	P-OT/forward run prohibition	N-OT/reverse run prohibition	Home signal	Not distributed	Not distributed	Not distributed	Not distributed

■ 0.4kW~1kW servo driver

 $\mathbf{0}$

 The SI1 SI2 channels of the driver are high-speed SI inputs with a response speed of less than or equal to 2 µs, and only support NPN connections. The SI3 SI4 SI5 SI6 SI7 channels are low-speed SI inputs with a response time of less than or equal to 2ms, and support NPN and PNP connections (SI3~SI7 can only have NPN or PNP connections at the same time).

• The typical voltage is DC24V, with a minimum not lower than DC18V and a maximum allowable voltage not higher than DC28V.

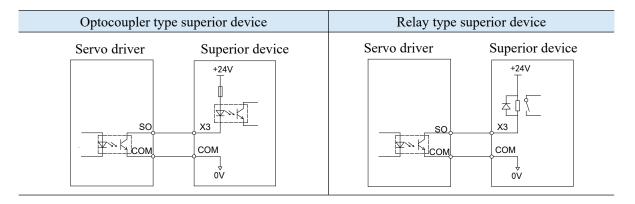

3.2.2 SO output terminals

Туре	Output terminal	Function
Optocouple	r SO1~SO4	Multifunctional output terminal
output	501~504	Multifunctional output terminal

Defaulted assignment of output terminals

Terminal	SO1	SO2	SO3	SO4
Function	/OCMP1 fly capture	ALM/alarm	Not distribute	Not distribute

■ Driver SO output circuit

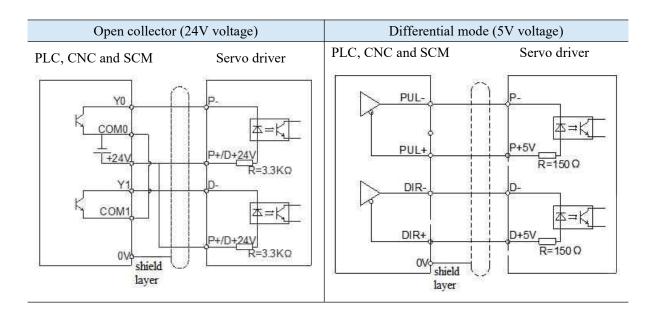

- Driver SO1 and SO2 are high-speed SO outputs, SO3 and SO4 are low-speed SO outputs, and all SO terminals only support NPN connection.
- Maximum load current: SO DC 50mA (maximum).

3.2.3 Pulse signal

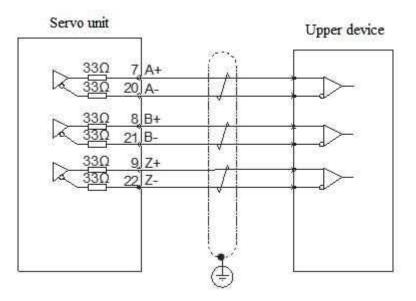

Instruction form	Optio n	Meaning	P-input signal	D-input signal	Chapter	
DO 10	0	CW/CCW dual-pulse mode	CW	CCW		
P0-10	1	AB phase mode	A phase	B phase	<u>5.4.2.3</u>	
XXX□	2	Pulse+direction mode	pulse	Direction		
Collector open circuit type (24V voltage) input signal is P+ 24V/D+ 24V						
Differential m	ode (5V v	voltage) input signal is P+5V/D	0+5V			

The wiring diagram of P+ D, CW, CCW and AB phase interface circuit is as follows:

3.2.4 Encoder feedback output signal

The encoder frequency division output circuit outputs differential signals through differential drivers, providing closed-loop feedback signals for the position control system of the upper device. On the upper device side, please use a differential or optocoupler receiving circuit to receive, with a maximum output current of 20mA.

4 Panel operation

4.1 Basic operation

4.1.1 Operating panel description

	Button	Operation
	STA/ESC	Short press: state switch, state return
		Short Press: The display data increases
	INC	Long press: The display data increases
		continuously
		Short Press: The display data decreases
	DEC	Long press: The display data decreases
STA/ESC INC DEC ENTER		continuously
	ENTED	Short press: shift.
	ENTER	Long press: Set and view parameters.

After power on, the panel will perform a self check operation, and all display digital tubes and five decimal points will light up for 1 second at the same time.

Four new status lights have been added, displaying the current activation status, error status, physical connection status, etc. The status description and flashing timing of the indicator lights are shown in the table below (with indicator lights in bus mode and no indicator lights in normal mode):

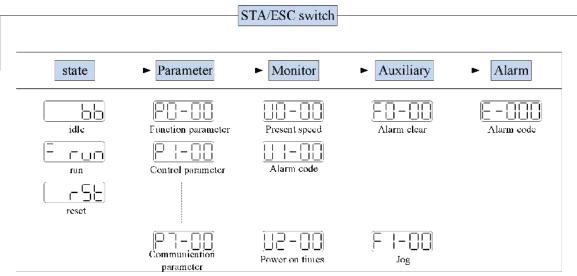

Indicator light	Status	Status
	OFF	INIT status
RUN	Blinking(ON 200ms/OFF 200ms)	Pre-Operational status
KUN	Single flash(ON 200ms/OFF 1000ms)	Safe-Operational status
	ON	Operational status
	OFF	No network malfunction
	Blinking(ON 200ms/OFF 200ms)	Abnormal communication
	Binking(ON 200ins/OTT 200ins)	settings
ERR	Single flash(ON 200ms/OFF 1000ms)	Synchronization event exception
	Double flash	
	(ON 200ms, OFF 200ms, ON 200ms, OFF	Application watchdog timeout
	1000ms)	
	OFF	Link not established
		Link established, with data
L/A IN	Flickering(ON 50ms/OFF 50ms)	transmission and reception
L/A IN LA OUT		signals
LA 001		Link established, no data
	ON	transmission and reception
		signals

4.1.2 Button operation

By switching the basic state of the panel operator, it can display the running state, set parameters, run auxiliary functions and alarm state. After pressing the STA/ESC key, the states are switched in the order shown in the following figure.

State: BB indicates that the servo system is idle; run indicates that the servo system is running; RST indicates that the servo system needs to be re-energized.

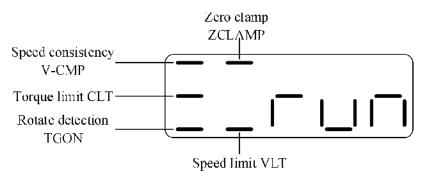

- Parametric setting PX-XX: The first X represents the group number, and the last two X represents the parameter serial number under the group.
- Monitor status UX-XX: The first X represents the group number, and the last two X represents the parameter number under the group.
- Auxiliary function FX-XX: The first X represents the group number, and the last two X represents the parameter number under the group.
- ♦ Alarm state E-XXX: The first two X represents the alarm category, and the last □ represents the small category under the category.

4.2 Operation state display

Parameter	Name	Default setting	Suitable mode	Meaning	Modify	Effective
P8-25	Panel display settings	0	All	 0: normal display, power on display "bb" or "run" 1: display the value of U-00 when powering on,speed feedback,unit:rpm 2: display the value of U0-07 when powering on, torque feedback, unit:% 	At once	Repower on

When powered on, the panel displays, which is set according to P8-25 parameters.

■ Speed, torque control mode

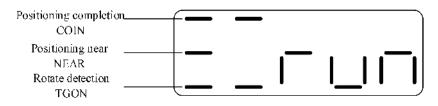

Digit display contents

Digit data	Display contents
P5-39	When the actual speed of the motor is the same as the command speed,
Same speed	turn on the light.
detection(/V-CMP)	Detection Width of Same Speed Signal: P5-04 (Unit: rpm)
	Speed control mode, when the torque exceeds the set value, turn on the
P5-42	light.
Torque limit(/CLT)	Internal Forward Torque Limitation: P3-28
	Internal Reverse Torque Limitation of: P3-29
P5-40	When the motor speed is higher than the rotating speed, turn on the lamp.
Rotate detection(/TGON)	Rotation detection speed: P5-03 (unit: rpm)
P5-31	When the rare clown signal starts to ensure the light
Zero clamp(/ZCLAMP)	When the zero clamp signal starts to operate, turn on the light.
	Torque control mode
P5-43	When the speed exceeds the set value, turn on the light
Speed limit(/VLT)	Forward speed limit in torque control: P3-16;
	Reverse speed limit: P3-17.

Simplified code display content

4.3 Group U monitor parameter

■ U0-21 input signal status

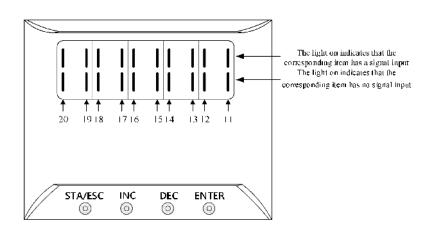

■ U0-21 input signal 1 distribution

Segment code	Description	Segment code	Description	
1	/S-ON servo enable	2	/P-CON proportion action instruction	
3	/P-OT prohibition of forward drive	4	/N-OT prohibition of reverse drive	
5	/ALM-RST alarm reset	6	/P-CL forward side external torque limit	
7	/N-CL reverse side external torque limit	8	/SPD-D internal speed direction selection	
9	/SPD-A internal speed selection	10	/SPD-B internal speed selection	
Note: When reading through communication the binary numbers read from right to left correspond to the				

Note: When reading through communication, the binary numbers read from right to left correspond to the position of /S-ON, /P-CON, 0 means that the position signal is not input, 1 means that the position signal has input. Example: 0x0001 means /S-ON has input, 0x0201 means /S-ON and /SPD-B has input.

■ U0-22 input signal status

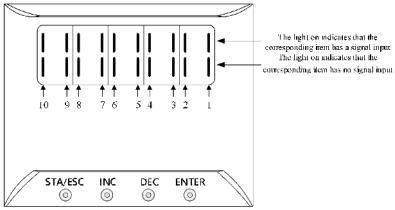

■ U0-22 input signal 2 distribution

Segment code	Description	Segment code	Description
11	/C-SEL control mode selection	12	/ZCLAMP zero clamp
13	/INHIBIT instruction pulse prohibition	14	/G-SEL gain switch
15	/CLR pulse clear	16	/CHGSTPchange step
17		18	
19		20	

Note: When reading through communication, the binary numbers read from right to left correspond to the position of /C-SEL, /ZCLAMP, 0 means that the position signal is not input, 1 means that the position signal has input. Example: 0x0001 means /C-SEL has input, 0x0009 means /C-SEL and / G-SEL have input.

Note:"-" is for reserved display and does not represent any signal. The status bit is always 0.

■ U0-23 output signal status

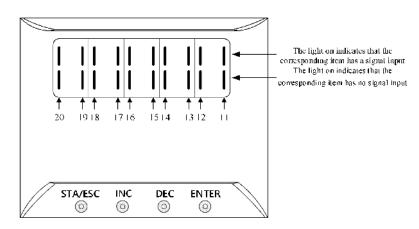

U0-23 output signal 1 distribution

Segment code	Description	Segment code	Description
1	Positioning completion hold(/COIN_HD)	2	Position completion(/COIN)
3	Same speed detection(/V-CMP)	4	Rotate detection(/TGON)
5	Ready (/S-RDY)	6	Torque limit(/CLT)
7	Speed limit detection(/VLT)	8	Break lock(/BK)
9	Warn (/WARN)	10	Output near(/NEAR)

Note: when reading status through communication, the binary from right to left correspond to the position of /COIN_HD, /COIN_0 means that the position signal is not output, 1 means that the position signal has output. Example: 0x0001 means / COIN_HD has output, 0x0201 means /COIN_HD and / NEAR has output.

■ U0-24 output signal status

■ U0-24 output signal 2 distribution

Segment code	Description	Segment code	Description
11	Alarm (/ALM)	12	Speed arrived (/V-RDY)
13	Customized output 1	14	Customized output 2
15	/Z phase	16	/MRUN
17		18	
19		20	

Note: When reading the status through communication, the binary numbers read correspond to the /ALM and /V-RDY positions from right to left. 0 represents that the position signal has no input, and 1 represents that the position signal has input. Example: 0x0001 indicates that/ALM has an output, and 0x0011 indicates that/ALM and /Z have an output.

4.4 Group F auxiliary parameters

4.4.1 Group F0 operation

Function code	Explanation	Function code	Explanation
			Panel external command auto
F0-00	Clear the alarm	F0-08	tuning
	Restore parameters to factory		
F0-01	settings	F0-09	Panel internal command auto tuning
F0-02	Clear position deviation	F0-10	Panel vibration suppression 1
F0-04	Clear historical alarm records	F0-11	Panel vibration suppression 2
			Panel vibration suppression (fast
F0-07	Panel inertia identification	F0-12	FFT)

4.4.2 Group F1 operation

Function code	Explanation	Function code	Explanation
F1-00	Jog run	F1-05	Software enable
F1-01	Test run	-	-
F1-02	Current sampling zero-correction	-	-

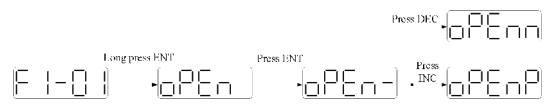

The following text introduces jogging, and the test run can only be carried out after motor identification. Please refer to section 5.1 for motor function settings.

(1) Test run (F1-01)

Before entering the test run mode, please confirm that the motor identification has been completed and the driver needs to be in the BB idle state!

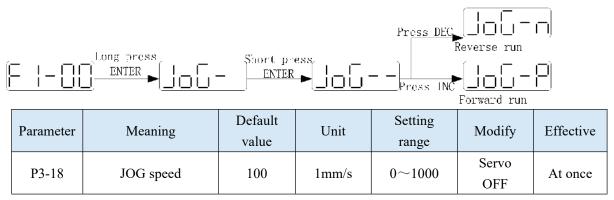

When the servo drive is connected to a non original encoder or power cable, it should first enter the test run mode to verify that the encoder terminal or power terminal is connected correctly.

The test run mainly checks the power cable and encoder feedback cable to determine if the connection is normal. The motor can achieve normal forward and reverse rotation as the following steps. If the motor shaft shakes or prompts an alarm, immediately disconnect the power and recheck the wiring.

(2) Jog run (F1-00)

Before entering jog mode, please confirm that the motor shaft is not connected to the machine and the driver is in bb idle status! The jog function is in speed mode, and P3-09 and P3-10 control the acceleration and deceleration time!

(3) Current sampling zero calibration (F1-02)

When the servo driver is updated or the motor runs unsteadily after a long time, it is recommended that the user automatically adjust the current detection offset, and carry out the following operations when the driver is bb idle.

Press STATUS/ESC to exit.It needs to repower on the driver.

(4) Forced enable (F1-05)

Parameter	Signal name	Setting	Meaning	Modify	Effective
P0-03	Enable	0	disable	Servo OFF	At once
	mode	1	I/O enable/S-ON		
		2	Software enable(F1-05 or		
		2	communication)		
		3(default)	Bus enable(Models supporting bus)		
Set P0-03=	2				

F1-05 = 0: cancel enable, enter bb status.

F1-05 = 1: forced enable, servo is in RUN status.

After power on again, the forced enable set by F1-05 will fail.

4.5 Fault alarm operation

When a fault occurs, the alarm status will automatically pop up, displaying the alarm number. If there is no fault, the alarm status will not be visible. In the alarm state, writing 1 to F0-00 through panel operation can reset the fault.

If the servo alarm is casued by power supply turning off, there is no need to clear the alarm.

When an alarm occurs, the cause of the alarm should be eliminated first, and then the alarm should be released.

4.6 Parameter setting example

Provide an example of the operation steps for changing the content of parameter P3-09 from 2000 to 3000.

Step	Panel display	Buttons	Operation
1		STA/ESC INC DEC ◎ ◎ ◎ ◎ ENTER	No need any operations
2	[P[] - [][]	STA/ESC INC DEC ◎ ◎ ◎ ◎ ENTER	Press STA/ESC to enter parameter setting
3	[P] - []]	STA∕ESC INC DEC ⊚ ⊚ ⊚ ENTER	Press INC, press once to add 1, increase the parameter to 3, and display P3-00
4	[P] - []]	STA∕ESC INC DEC ◎ ◎ ◎ ◎ Enter	Short press the ENT key, and the last 0 on the panel will flash
5	[2]-[]]	STA∕ESC INC DEC ⊚ © ⊚ ⊚ ENTER	Press the INC key to add up to 9
6	[2]-[]]	STA/ESC INC DEC ◎ ◎ ◎ ◎ ENTER	Long press the ENT key to enter P3-09 for numerical changes.
7		STA/ESC INC DEC ⊚ ⊚ ⊚ © Enter	Press the INC, DEC, and ENT keys to add, subtract, and shift. After making the changes, press and hold the ENT key to confirm
8		END	

When the set parameters exceed the range that can be set, the driver will not accept the set value and will report E-021 (parameter setting exceeded). Parameter setting exceeding the limit usually occurs when the upper computer writes parameters to the driver through communication.

5 Basic functions

5.1 Motor function setting

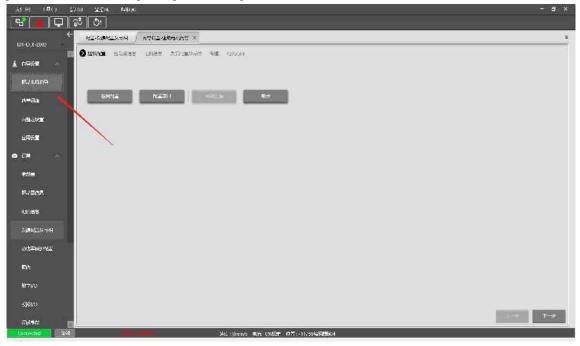

When connecting the driver to the linear motor, it is necessary to set the relevant motor parameters, identify the motor, and perform other operations before the motor can be controlled to operate normally. This section introduces how to use the upper computer software to configure and identify the phase sequence of the drive motor to help control the motor to operate normally.

5.1.1 Connection between upper computer and driver

The communication method between the upper computer software and the servo drive is wired communication, with one end of the Type-C cable connected to the computer and the other end connected to the servo drive.

5.1.2 Communication configuration

1. Click on the [Drive Motor Wizard] on the left side of the main interface, and you can see the first step of the Wizard Settings - Drive Motor Wizard - Communication Configuration. After entering the Drive Motor Wizard configuration, the interface will display operation methods such as [Network Configuration], [Configure Serial Port], [Automatic Connection], and [Disconnect].

2. After clicking on [Configure Serial Port], the [Connect Servo] window will pop up. On this interface, you can manually set the serial port number, baud rate, data bits, and other data related to the serial port. After the configuration is complete, click 'Confirm'.

3. After the serial port data configuration is correct, you can click on automatic connection to connect the servo drive. If the drive information and motor information are displayed correctly, click [OK] to exit [Connection] and start reading data. During the data reading process, a progress bar (data reading progress) is displayed in the lower right corner of the interface. After successful connection, Connected will be displayed in the lower left corner.

 $\mathbf{0}$

Automatic connection is only valid for station number 1. Automatic connection can automatically search for serial ports that can communicate with the servo, and read information about the driver and motor.

Click [Disconnect] to disconnect the software from the servo.

5.1.3 Driver information

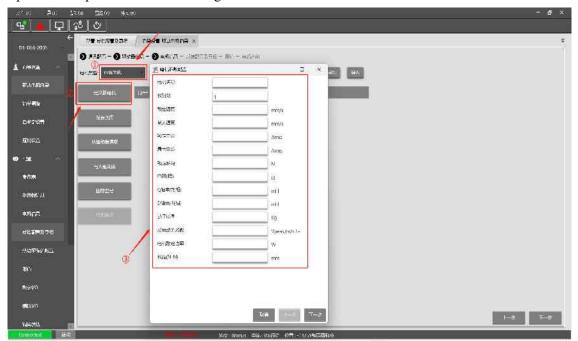

After establishing the connection correctly, you can click Next to enter the drive information interface, where you can see the relevant information of the connected drive, as shown in the following figure:

		· · · · · · · · · · · · · · · · · · ·			- e x

5.1.4 Motor configuration

1. After correctly connecting and determining the driver information, a new motor needs to be defined for the first connection. Select [Linear Motor] – [Define New Motor] – [Motor Parameter Configuration] in the following interface, and compare it with the motor parameters provided by the motor manufacturer to complete all the parameters in the configuration table.

2. After filling in the parameters completely, click Next to enter the encoder configuration. On this interface, you can select the corresponding encoder type.

좌音编码器类型			
02编码器			
BZ编码能,HALL			
uss C编码并			000

In addition, the motor temperature detection thermocouple disconnection alarm shielding can be set on this interface. Currently, only PT100 thermal resistance temperature detection is supported, and other thermal resistances need to shield this alarm.

5. After completing the thermal power protection configuration, click ok, and the interface parameters will be refreshed to the filled content. After configuring the relevant information, the parameters need to be saved to the library for easy use during each subsequent connection or to write values to other drives.

6. After completing the previous operation, write the parameters of the library into the drive, and the interface will display [Please wait for soft reset to complete]. After clicking OK, the drive will automatically perform parameter writing and reset, and the drive panel will display single (-) → E → 1 → (----) → 88888 → bb in sequence. The servo does not need to be repowered on again.

5.1.5 Motor and phase sequence identification

Due to the fact that linear motors and linear drivers are not provided by the same manufacturer. Therefore, the relevant information of linear motors cannot be obtained. Therefore, an automatic motor verification function was developed. The linear motor with ABZ, ABZ+HALL, BISS-C encoder interface can operate normally after completing the motor verification function and phase finding.

The content of verification includes encoder polarity, BISS-C absolute value encoder zero position, HALL polarity and HALL initial position, motor phase sequence identification. Any new motor brought for the first time requires the use of motor verification function. At present, motor verification can only be performed using an upper computer.

• Inductance and Resistance Identification: Find the identification results of motor resistance, motor D-axis inductance Ld, and motor Q-axis inductance Lq. After clicking on motor identification, a motor identification configuration box will pop up. Simply click on inductance and resistance identification to automatically perform inductance and resistance identification.

The identification of inductance and resistance requires correct connection to the motor before operation. After the identification is completed, the identification result will be displayed and filled in the identification result field in the figure.

• Power cable phase sequence identification: finding the zero position.

• If it is an ABZ encoder, it needs to undergo phase sequence identification before it can be used normally. Select the phase sequence identification in motor identification, choose the encoder type and configure the magnetic grating/grating resolution, and then write it to the driver. Click on phase sequence identification to complete the operation.

5.1.8 Motor direction selection

After entering the direction of the motor, the starting running direction of the motor can be configured and selected according to the specific working conditions. At this point, the drive motor guide ends, and clicking ok will enter the simple tuning interface.

5.2 Error correction function

5.2.1 Error correction function overview

In precision electromechanical applications (such as silicon crystal/semiconductor/TP industries), there are usually high absolute accuracy control requirements.

However, due to the inherent errors of linear driving motors (such as motor installation parallelism/flatness/concentricity, material thermal deformation, design tolerances, etc.), encoder errors (such as grating design tolerances, uneven grating line processes, grating thermal deformation, insufficient parallelism/concentricity of the grating and read head assembly, etc.), and motor wear errors caused by long-term operation, the actual motor position information may significantly differ from the position information fed back by the encoder. In practice, servo drives can only use the position information fed back by encoders as a reference for motor position control. As a result, the inaccuracy of encoder feedback ultimately leads to inaccurate absolute precision control of direct-drive motors, making it difficult to meet the high absolute precision requirements of precision electromechanical applications.

To address this, external measurement devices (such as laser interferometers) can be used to generate an error mapping table. The error mapping is stored in the drive's non-volatile memory. The drive retrieves correction values in real-time based on the actual position and performs error correction. After implementing these corrections, the absolute positioning accuracy of linear motors is improved.

Parameter	Name	Setting range	Meaning	Setting time	Effective time	Default value
PA-70	Error correction switch	0-1	0: OFF 1: ON	Servo OFF	At once	0
PA-71	Error correction starting position low bit	0-65535	Error correction starting position = high bit*10000 + low bit	Servo OFF and the error correction function is turned off	Servo ON	0
PA-72	Error correction starting position high bit	0-65535	Error correction starting position = high bit*10000 + low bit	Servo OFF and the error correction function is turned off	Servo ON	0
PA-73	Error correction interval low bit	0-65535	Error correction interval= high bit*10000 + low bit	Servo OFF and the error correction function is turned off	Servo ON	0

5.2.2 Parameter settings related to error correction

Parameter	Name	Setting range	Meaning	Setting time	Effective time	Default value
PA-74	Error correction interval high bit	0-65535	Error correction interval= high bit*10000 + low bit	Servo OFF and the error correction function is turned off	Servo ON	1
PA-75	Error correction length	0-65535	Can be set to be less than the length of the error correction table	Servo OFF and the error correction function is turned off	Servo ON	10
PA-76	Error correction unit	0-65535	0: um 1: mm	Servo OFF and the error correction function is turned off	Servo ON	0
PA-77	Error correction instruction direction	0-65535	0: Forward, the direction of movement when generating the error correction table is consistent with the encoder's incremental direction. 1: Reverse, the direction of movement when generating the error correction table is not consistent with the encoder's incremental direction.	Servo OFF and the error correction function is turned off	Servo ON	0
PA-78- PA-177	Error correction array [100]	-32768-32767	Error correction data, maximum 1mm	Servo OFF and the error correction function is turned off	Servo ON	0

5.2.3 Parameter monitor

Parameter	Name	Meaning
U4-29	Error correction index value	After the error correction function is activated, the correction index position where the current position of the linear motor is located is also used for the correction position cursor in the upper computer.

Parameter	Name	Meaning
U4-30	 High 8 bits: 1: Error correction takes effect 0: Error correction not effective Low 8 bits: 0: Homing unfinished 	Used for obtaining error correction and homing state on the upper computer.
	1: Homing completed	
U0-94~U0-97	Encoder feedback incremental value, clear this position after homing completed	This position is displayed at the bottom of the error correction upper computer interface

5.2.4 Function introduction

- When using the error correction feature for precision compensation, a laser interferometer must be used. The Xinje linear drive upper computer supports directly loading the .rtl error correction table automatically generated by the laser interferometer. If other measuring devices are used, error correction values must be calculated manually and configured in the upper computer.
- After loading the error correction table file (.rtl), you need to configure the starting position, error correction table interval, index length requiring error correction, and the direction configuration of the error correction table according to the correction units.
- Once the above configurations are completed, write the .rtl error correction parameters into the linear servo drive. Before using it, it is necessary to perform a homing operation. After homing, enable the error correction switch and activate the drive for normal operation. At this point, error correction will automatically occur during operation to ensure high-precision functioning.

5.2.5 Error correction interface introduction

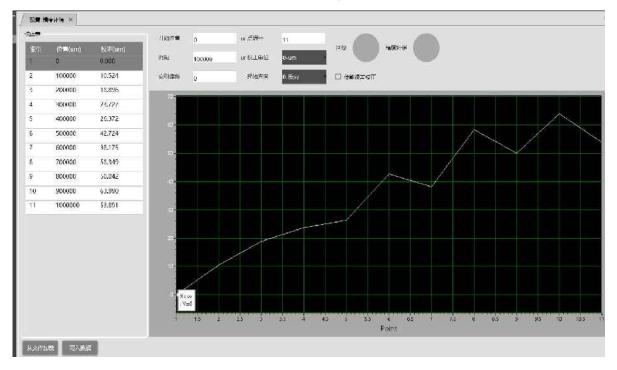

After the laser interferometer completes the measurement, a set of error data is automatically generated, which includes: interval, number of target runs, and error data. Once the upper computer loads the .rtl data generated by the laser interferometer, it will automatically display on the error correction interface. The parameters in the interface are explained as follows:

Parameter	Explanation
name	
Start	The starting position for error correction is set to 0 by default.
position	
Point	The total length of the error correction index is automatically loaded from. rtl and can
number	be manually configured, but must be less than or equal to the length of the correction
number	table.
Interval	The interval distance of the error correction table is automatically loaded from. rtl, and
Interval	the unit needs to be manually configured.
Correction	The unit of error correction table data.
unit	
Start	Based on the actual configuration during the measurement phase.

Parameter name	Explanation
direction	Forward Direction: During the error correction measurement phase, the motor movement direction results in increasing encoder counts.
	Reverse Direction: During the error correction measurement phase, the motor movement direction results in decreasing encoder counts.

Using specification:

- The maximum supported compensation points are 100.
- The error correction function for ABZ encoder takes effect after homing. The BISS-C encoder type can choose not homing.
- After homing, there will be a prompt on the corresponding indicator light, as well as a prompt after the error correction takes effect.
- After the error correction takes effect, when the motor moves to the corresponding error compensation index value, there will be a cursor prompt.
- After the error correction function is enabled, it is not allowed to modify the parameters related to error correction.
- The maximum error data in error correction is 1mm.
- The interval setting must be a positive number and negative intervals should not be used.
- The error correction function is only effective in position mode.

5.2.6 Error correction application

(1) Configuration of laser interferometer

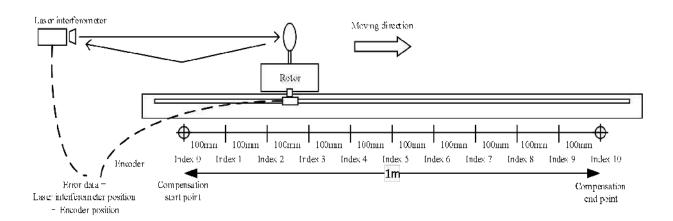

In this example, a laser interferometer is used to generate error correction data. The total stroke of error correction compensation is 1m. The driver moves at equal intervals of 100mm for a total of 11 times. After each 100mm run, it stops for 6 seconds. The longer this time, the more accurate the data obtained by the laser interferometer. After

the operation, the laser interferometer generated a total of 11 error data points.

Before collecting data with a laser interferometer, please do homing operation for the motor.

(2) Schematic diagram of using laser interferometer

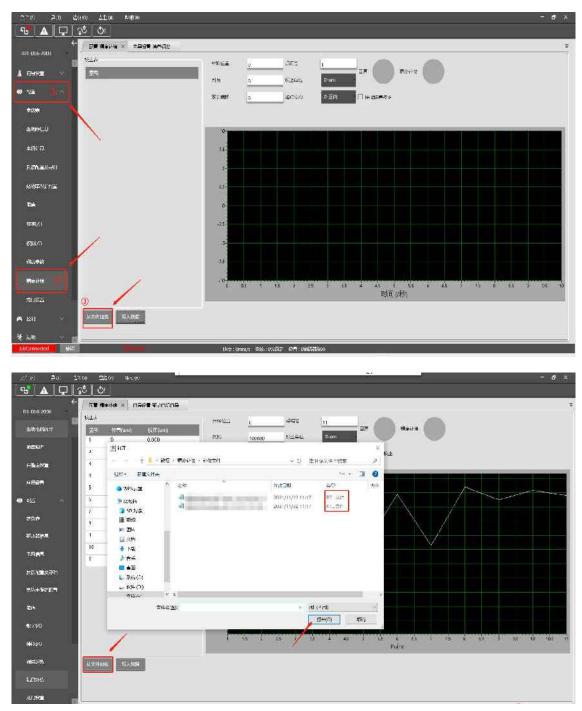

(3) Precision compensation (error correction) data table generated by laser interferometer

Index	Encoder position (um) Y1	Laser interferometer external detection location (um) Y2	Correction value(um) Y3 = Y2-Y1

(4) Upper computer software processing

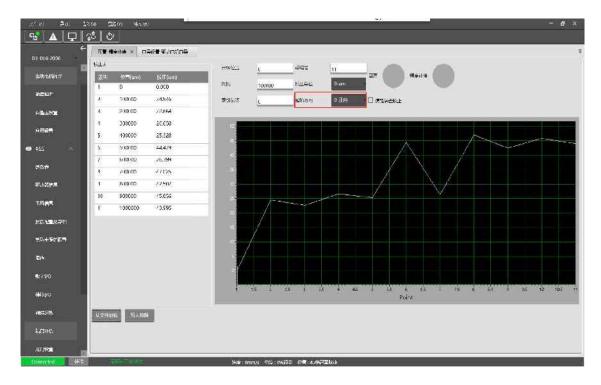

After generating the precision compensation (error correction) data table (. rtl) for the laser interferometer, click on the upper computer software precision compensation interface, click on load from file, and select the data table saved from the laser interferometer:

After the file is loaded, the current interface will display the parameter file data and corresponding curve:

LIBH:											

After completion, click on enable error correction (turn on the precision compensation switch), enable normal operation, and complete the precision compensation configuration.

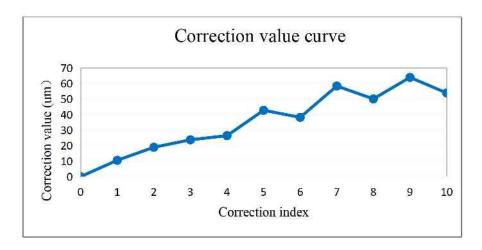

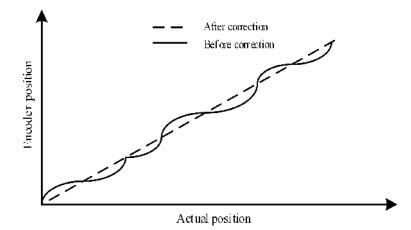

There is no unit data in the. rtl file. Please ensure that the correction unit configuration is correct before use.

- The default starting position parameter is 0. For error correction using BISS-C encoder, if it does not homing, the starting position can be configured as the encoder feedback count value (encoder unit) at the starting position when generating the error correction table.
- The interval needs to be configured as a positive number. If the movement direction of the error correction table is generated and the encoder feedback is increasing (speed is positive), the starting direction is set to 0 (positive direction). If the movement direction of the error correction table is generated and the encoder feedback decreases (with a negative speed), the starting direction is set to 1 (reverse).

Correction value curve:

The schematic diagram of the position curve after error correction is as follows:

5.3 Stop mode

Servo shutdown can be divided into free shutdown, deceleration shutdown, and dynamic braking (DB) shutdown according to the shutdown methods. The following is an explanation of the servo shutdown methods.

Stop mode	Free shutdown	Decelerating shutdown	DB shutdown
Shutdown principle	The servo drive is not enabled, the servo motor is not powered on, and it can freely decelerate to 0. The deceleration time is affected by mechanical inertia, equipment friction, and other factors.	The servo driver outputs reverse braking torque, and the motor quickly decelerates to 0.	The servo motor operates in a short-circuit braking state.
Shutdown characteristics	Advantages: Smooth deceleration, low mechanical impact, but slow deceleration process, smooth deceleration, low mechanical impact Disadvantage: Slow deceleration process	Advantages: Short deceleration time Disadvantage: There is mechanical impact	Advantages: Short deceleration time Disadvantage: There is mechanical impact

According to the different scenarios of servo shutdown, it can be divided into servo OFF shutdown, alarm shutdown, and overtravel shutdown.

All power segments of the DL6 series come standard with Dynamic Braking (DB) function.

5.3.1 Servo OFF and alarm shutdown

 Related para 	ameters
----------------------------------	---------

Parameter	Meaning	Default Unit Range		Range	Modify	Effective
P0-30	Stop timeout time	20000	1ms	0~65535	Servo bb	At once
P0-27	Servo turn off enable shutdown mode	0	-	0~5	Servo bb	At once
P0-29	Alarm shutdown mode	2	-	0~5	Servo bb	At once

Parameter	Value	Meaning		
	0	Free running stops and remains in a free running state after stopping.		
	1	Free running stops and maintains DB status after stopping.		
	2	Deceleration braking stops, and after stopping, it remains in a free		
P0-27	2	running state.		
	3	Deceleration braking stops and maintains DB status after stopping.		
	4	DB stops and remains in a free running state after stopping.		
	5	DB stops and remains in DB state after stopping.		
		Turn off enable property alarm		
P0-29	0	Free running stops and remains in a free running state after stopping.		
	1	Free running stops and maintains DB status after stopping.		

2	DB stops and remains in a free running state after stopping.
3	DB stops and remains in DB state after stopping.
4	DB stops and remains in a free running state after stopping.
5	DB stops and remains in DB state after stopping.
	Not turn off enable property alarm
0	Free running stops and remains in a free running state after stopping.
1	Free running stops and maintains DB status after stopping.
2	Deceleration braking stops, and after stopping, it remains in a free running state.
3	Deceleration braking stops and maintains DB status after stopping.
4	DB stops and remains in a free running state after stopping.
5	DB stops and remains in DB state after stopping.

Note:

1. servo turn off enable shutdown mode (P0-27)

(1) When P0-27=0, if the servo OFF occurs, the motor starts to rely on free stop without any alarm.

(2) When P0-27=1, if the servo OFF occurs, the motor starts to rely on free stop and maintains the DB state after stopping.

(3) When P0-27=2, if the servo OFF occurs, the motor starts to rely on deceleration to stop, until the speed is less than 50rpm before turning to free stop. At the same time, the servo will time the deceleration stop stage. If the timing time has exceeded P0-30 and the motor speed has not dropped below 50rpm during the deceleration process, an alarm E-262 will show.

(4) When P0-27=3, if the servo OFF occurs, the motor starts to rely on deceleration to stop, until the speed is less than 50rpm before turning to free stop. At the same time, the servo will time the deceleration stop stage. If the timing time has exceeded P0-30 and the motor speed has not dropped below 50rpm during the deceleration process, an alarm E-262 will show. Maintain DB status after stopping.

(5) When P0-27=4, if the servo OFF occurs, the motor DB stops and remains in a free running state after stopping.

(6) When P0-27=5, if servo OFF occurs, the motor DB stops and maintains the DB state after stopping.

2. Servo alarm shutdown mode (P0-29)

(1) Turn off enable property alarm

When P0-29=0, if a servo alarm occurs, the motor starts to rely on free stop.

When P0-29=1, if a servo alarm occurs, the motor starts to rely on free stop and remains in DB state after stopping.

When P0-29=2, if a servo alarm occurs, the motor DB stops and remains in a free running state after stopping.

When P0-29=3, if a servo alarm occurs, the motor DB stops and maintains the DB state after stopping.

When P0-29=4, the motor DB stops and remains in a free running state after stopping.

When P0-29=5, if a servo alarm occurs, the motor DB stops and maintains the DB state after stopping.

(2) Not turn off enable property alarm

When P0-29=0, if a servo alarm occurs, the motor starts to stop freely.

When P0-29=1, if a servo alarm occurs, the motor starts to stop freely and remains in DB state after stopping.

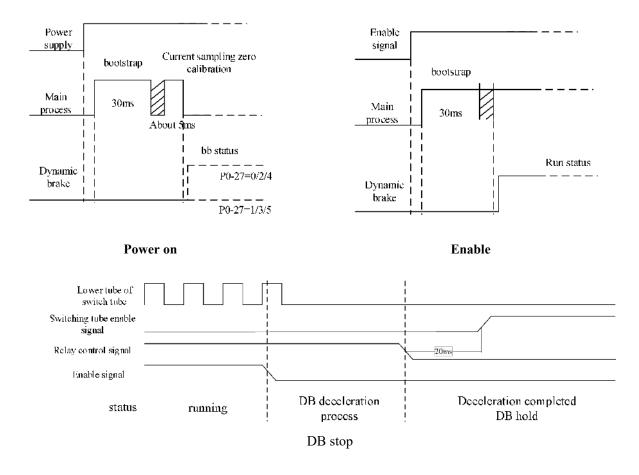

When P0-29=2, if a servo alarm occurs, the motor starts to rely on deceleration to stop, until the speed is less than 50mm/s before turning to a free stop. At the same time, the servo will time the deceleration stop stage. If the timing time exceeds P0-30 during the deceleration process, the servo will directly stop freely. At this time, due to the servo being in an alarm state, regardless of the value of P0-29, there will be no alarm E-262. Maintain free running status after stopping.

When P0-29=3, if a servo alarm occurs, the motor starts to rely on deceleration to stop, until the speed is less than 50mm/s before turning to a free stop. At the same time, the servo will time the deceleration stop stage. If the

timing time exceeds P0-30 during the deceleration process, the servo will directly stop freely. At this time, due to the servo being in an alarm state, regardless of the value of P0-29, there will be no alarm E-262. Maintain DB status after stopping.

When P0-29=4, if a servo alarm occurs, the motor DB stops and remains in a free running state after stopping. When P0-29=5, if a servo alarm occurs, the motor DB stops and maintains the DB state after stopping.

Dynamic Braking (DB) Timing Diagram (Dynamic Braking Low Level indicates effectiveness):

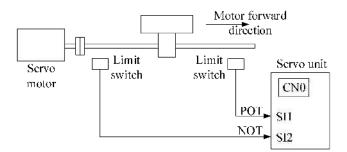

5.3.2 Stop mode when overtravel in normal mode

The overtravel prevention function of the linear servo unit refers to the safety function of forcibly stopping the linear servo motor by inputting a limit switch signal when the movable part of the machine exceeds the designed safe movement range.

parameter	Meaning	Default setting	Unit	Setting range	Modify	Effective
P0-28	Servo override stop mode	2	-	0~3	Servo bb	At once
P0-30	Stop timeout	20000	1ms	0~65535	Servo bb	At once
P5-22	Forward run prohibition /P-OT	n.0001	-	- 0~ff		At once
P5-23	Reverse run prohibition /N-OT	n.0002	-	0~ff	Anytime	At once

Related parameter

Be sure to connect the limit switch as shown in the figure below.

Rotary applications such as round tables and conveyors do not need the function of overrun prevention. At this time, there is no need to connect the overrun prevention with input signals.

	-			
Parameter setting	Signal /POT, terminal	Overtravel signal (/POT, /NOT) terminal		
i arameter setting	input status	logic		
P5-22/P5-23=n.0000	No need to connect			
P 3-22/P 3-23-11.0000	external input			
D5 22/D5 22 000-	SI□ terminal has no signal	invalid		
P5-22/P5-23=n.000□	input	iffvalld		
P5-22/P5-23=n.001□	SI□ terminal has signal			
P 5-22/P 5-25-11.001	input			
P5-22/P5-23=n.0010	No need to connect			
P 3-22/P 3-23-11.0010	external input			
P5-22/P5-23=n.000□	SI□ terminal has signal	valid		
r <i>3-22/</i> r <i>3-</i> 25−11.000⊔	input	valld		
P5-22/P5-23=n.001□	SI□ terminal has no signal			
F J-22/F J-23−11.001□	input			

Parameter settings in forward limit signal /POT and reverse limit signal /NOT can not be set to the same terminal input at the same time.

Direction	Meet the limit	Operation status
Forward	positive limit is valid	POT, set the servo overrun stop mode as P0-28
run	negative limit is valid	Alarm E-261
Reverse	positive limit is valid	Alarm E-261
run	negative limit is valid	NOT, set the servo overrun stop mode as P0-28

Parameter	Value	Meaning
	0	The deceleration stops 1, the overrun direction moment is 0 after
	0	stopping, and receiving instructions.
	1	Inertia stops, after stopping, overrun direction moment is 0,
P0-28	2	receiving instructions.
		The deceleration stops 2, after stopping, the overrun direction does
		not receive instructions.
	3	Alarm (E-260)

0

When P0-28 = 0/2, the motor starts to decelerate and stop after receiving the overtravel stop signal, and the stop timeout also plays a role in the overtravel process.

During position control, when the motor is stopped by over travel signal, there may be
position deviation pulse. To clear the position deviation pulse, the clear signal /CLR
must be input. If the servo unit still receives pulses, they will accumulate until the
servo unit gives an alarm.

5.3.3 Stop mode when overtravel in bus mode

In the bus control modes PP, CSP, PV, CSV, TQ, and CST, according to the P0-28 setting value, when encountering POT and NOT signals, the servo has different processing methods.

Parameter	Meaning	Default setting	Unit	Setting range	Modify	Effective
P0-28.0	 0: Direct alarm, using servo deceleration shutdown method 1: Alarm triggered after deceleration and shutdown in 605Ah mode 2: Not using overtravel, controlled by the master station 	2	-	0~3	0	1 3 4 8 9 10

The motor is in a prohibited state

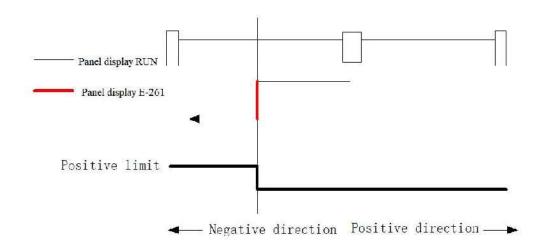

Scenario 1: When the servo is in an enabled or disabled state and touches the reverse limit switch, the panel will display NOT, cancel the reverse limit signal, and the panel will return to its previous state.

Scenario 2: When the servo is in an enabled or disabled state and touches the forward limit switch, the panel will display POT, cancel the forward limit signal, and the panel will return to its previous state.

Scenario 3: When the servo is in an enabled or disabled state and simultaneously touches the forward and reverse limit switches, the servo will report E-261. If two limit signals are cancelled, the panel will return to its previous state; If any limit signal is cancelled, the panel will display another limit signal, which needs to be cancelled before the panel can return to its previous state.

- The motor is in motion state
- 1. Mistakenly touching the reverse limit

Taking the initial movement direction of the motor as the left as an example, when accidentally touching the forward limit switch, the servo will report E-261. If the forward limit switch is cancelled first, and then the alarm is cleared, the shaft will return to a non enabled state, and both the forward and reverse directions of the shaft can move; If the alarm is cleared first and the axis returns to the disabled state, but the panel still displays POT, the axis is still in the forward limit restricted state. The forward limit signal needs to be cancelled in order to release the forward overtravel prohibition.

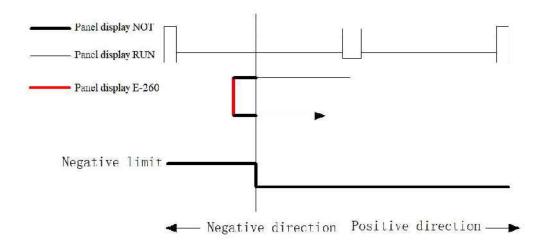

2. Limit overtravel state

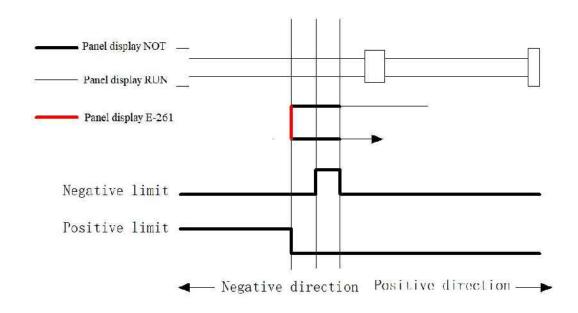

When P0-28 is 1, servo will control the deceleration stop alarm.

(1) Initial movement direction to the left, triggering the overtravel signal without occurrence of offside Scenario 1: Failure to touch the forward limit switch

The initial direction of movement is left. When touching the rising edge of the reverse limit switch, the panel display changes from RUN to NOT, triggering the reverse overtravel deceleration stop. The shaft stops on the reverse limit switch, and the servo will report E-260. The alarm must be cleared to move the axis in the forward direction. When it touches the falling edge of the reverse limit switch, the panel display can change from NOT to RUN, and the reverse overtravel prohibition can be released.

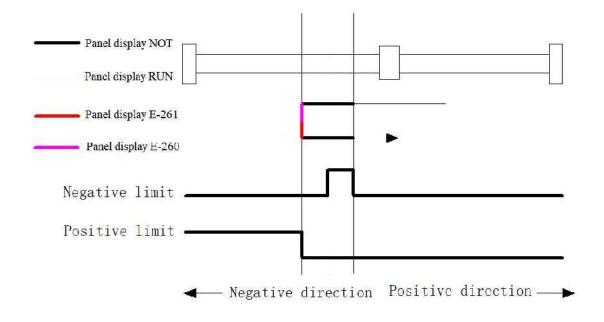

Scenario 2: In the case of offside, touch the forward limit switch before the axis deceleration stop is completed. The initial direction of movement is left. When touching the rising edge of the reverse limit switch, the panel display changes from RUN to NOT, triggering the reverse overtravel deceleration stop. However, the axis crosses the reverse limit switch and triggers the falling edge of the reverse limit switch. Before the shaft stops, if the forward limit switch is touched, the servo will report E-261. The forward limit switch must be cancelled in order to clear the E-261 alarm. Otherwise, the alarm cannot be cleared. Then, the shaft moves forward and touches the rising and falling edges of the reverse limit switch again. Only then can the panel display change from NOT to RUN, and the reverse overtravel prohibition be released.

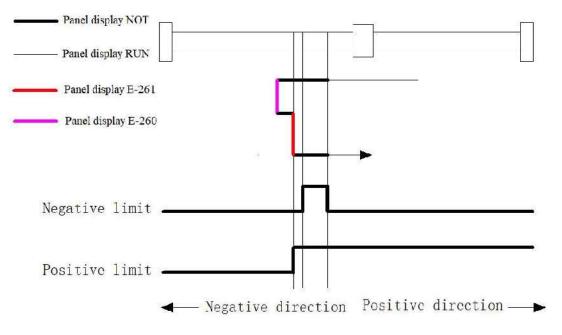

Scenario 3: In the case of offside, when the shaft stops, touch the forward limit switch.

The initial direction of movement is left. When touching the rising edge of the reverse limit switch, the panel display changes from RUN to NOT, triggering the reverse overtravel deceleration stop. However, the axis crosses the reverse limit switch and triggers the falling edge of the reverse limit switch. When the shaft stops, the servo will report E-260. At this time, if the forward limit switch is touched, the servo will report E-261. The forward limit switch must be cancelled before the E-261 alarm can be cleared. Otherwise, the alarm cannot be cleared. Then, the shaft will move forward and touch the rising and falling edges of the reverse limit switch again. Only then can the panel display change from NOT to RUN, and the reverse overtravel prohibition be released.

Scenario 4: In the case of offside, touching the forward limit switch during axial forward movement.

The initial direction of movement is left. When touching the rising edge of the reverse limit switch, the panel display changes from RUN to NOT, triggering the reverse overtravel deceleration stop. However, the axis crosses the reverse limit switch and triggers the falling edge of the reverse limit switch. When the shaft stops, the servo will report E-260. After clearing the alarm to move the shaft forward, if the forward limit switch is touched, the servo will report E-261. The forward limit switch must be cancelled before the E-261 alarm can be cleared. Otherwise, the alarm cannot be cleared. Continue to move the shaft forward, touch the rising and falling edges of the reverse limit switch again, and the panel display can change from NOT to RUN to release the reverse overtravel prohibition.

5.4 Position control

5.4.1 Universal position mode

5.4.1.1 Pulses per polar distance/electronic gear ratio

The so-called electronic gear ratio is actually the displacement of the motor when the load shaft displacement is one instruction unit. Linear motors are used for linear motion, with a default reduction ratio of 1:1.

- After writing the polar distance into the motor parameters, only the required number of pulses for each polar distance needs to be allocated to P0-11/P0-12. For example, 10000 pulses move one polar distance, and the parameter is set to: P0-11=0/P0-12=1.
- In precise positioning, if the required number of pulses per polar distance P0-11/P0-12 cannot be achieved, electronic gear ratios can be used, and the setting method is:

 $\frac{\text{Electronic gear ratio numerator P0} - 13}{\text{Electronic gear ratio denominator P0} - 14} = \frac{\text{Grating resolution}}{\text{Pulses per polar distance}}$

Parameter	Meaning	Default setting	Unit	Setting range	Modify	Effective
P0-11	Pulses per polar distance*1	0	pul	0~99999	Servo OFF	At once
P0-12	Pulses per polar distance *10000	0	pul	0~9999	Servo OFF	At once
P0-13	Electronic gear ratio (numerator)	1	-	0~65535	\checkmark	At once
P0-14	Electronic gear ratio (denominator)	1	-	0~65535	Servo OFF	At once
P0-92	Group 2 Electronic gear ratio (numerator) low bit*1	1	-	1~99999	\circ (mode 5) √(mode 6)	At once
P0-93	Group 2 Electronic gear ratio (numerator) high bit*10000	0	-	0~65535	\circ (mode 5) √(mode 6)	At once
P0-94	Group 2 Electronic gear ratio (denominator) low bit*1	1	-	1~99999	Servo OFF	At once
P0-95	Group 2 Electronic gear ratio (denominator) high bit*10000	0	-	0~65535	Servo OFF	At once

Related parameters

0

Parameters P0-11 to P0-14 all relate to the electronic gear ratio. P0-11 and P0-12 form one group, while P0-13 and P0-14 form another group. The pulses per polar distance, P0-11 and P0-12, take precedence over the electronic gear ratio, P0-13 and P0-14. The electronic gear ratio P0-13 and P0-14 only becomes effective when both P0-11 and P0-12 are set to zero. In special cases, if the calculated pulses per polar distance result in a decimal number, the use of the electronic gear ratio should be considered.

- When P0-11, P0-12, P0-13, and P0-14 are all set to zero, then P0-92, P0-93, and P0-94, P0-95 will become effective. If P0-13 and P0-14 exceed the set range, please reduce the electronic gear ratio to its simplest form. If it still exceeds the parameter setting range after reduction, please use the second set of gear ratios, P0-92 to P0-95. The second set of gear ratios only becomes effective when P0-11 to P0-14 are all set to zero.
- Instruction units do not represent machining accuracy. Refining the instruction unit quantity based on mechanical accuracy can improve the positioning accuracy of servo.

5.4.1.2 Positioning completion signal (/COIN, /COIN_HD)

In position control, the signal indicating the completion of servo motor positioning is used when the command controller needs to complete positioning confirmation.

Parameter	Meaning	Default setting	Unit	Range	Change	Effective
P5-00	Positioning completion width	144	Command unit	0~65535	Anytime	At once
P5-01	Positioning completion detection mode	0	-	0~3	Anytime	At once
P5-02	Positioning completion hold time	0	ms	0~65535	Anytime	At once

Related parameters

Parameter	Signal name	Default setting	Suitable mode	Meaning	Modify	Effective
P5-37	/COIN-HD	n.0000	5 6	Positioning complete holding	Anyti me	At once
P5-38	/COIN	n.0000	5 6	Positioning complete output	Anyti me	At once

Refer to section 3.2.2 for hardware wiring details.

If it is necessary to output signal from SO2, P5-37 and P5-38 are set to n.0002/0012. Note that an SO terminal can only be used as a signal function.

1. Conditions for positioning completion signal output

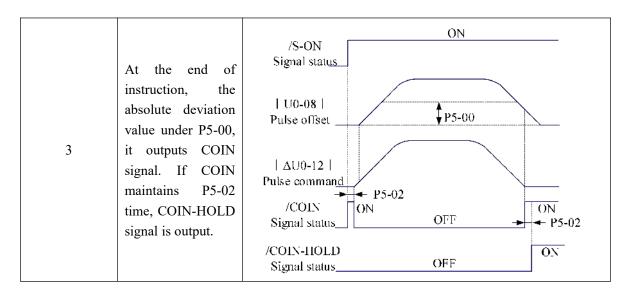

(1) /COIN-HD signal output conditions

When the positioning completion detection mode P5-01 is set to 3, the positioning completion holding /COIN-HD signal can be output. When the /COIN signal holds P5-02 time, the COIN-HD signal can be output.

(2) /COIN signal output conditions

The following is the precondition for positioning output and the output diagram.					
P5-01 setting	Content	Diagram			
	If the absolute deviation is below	/S-ON signal			
0	P5-00, the COIN signal will be output.	U0-08 Pulse offset P5-00			
	1	signal ON OFF ON			
1	After the instruction is finished, the deviation is below P5-00 and COIN signal is output.	ON /S-ON Signal status U0-08 Pulse offset Pulse offset /COIN Signal status ON			
		ON ON			
	When the instruction ends	/S-ON Signal status			
	and the motor speed is under the rotation detection	Pulse offset $P5-00$			
2	speed (P5-03) and the absolute deviation is less	Pulse comma <u>nd</u>			
	than P5-00, the COIN signal is output.	U0-00 Actual speed			
		/COIN Signal status OFF			

According to the positioning completion detection mode set in P5-01, output positioning completion /COIN signal. The following is the precondition for positioning output and the output diagram.

2. Description of positioning completion width

(1) The positioning completion width P5-00 changes proportionally due to the change of electronic gear ratio, and the factory default is 144 command units.

The following table is an example:

¥	
The number of command pulses required for a motor to operate at one polar distance	positioning completion width P5-00
10000(default)	144(default)
20000	288
5000	72
3000	42
2000	28

The positioning completion width P5-00 varies proportionally with the number of command pulses required for the motor to run one polar distance.

The output of the positioning completion signal depends on the positioning completion width. The smaller the width, the later the positioning completion signal output, but the signal output does not affect the actual operating status of the motor.

(2) The positioning completion width can also be set separately, and its modification will not affect the number of command pulses required for the motor to operate at one polar distance.

5.4.1.3 Positioning near signal (/NEAR)

The servo motor is located near the positioning completion signal, so that the equipment can prepare the next action in advance.

Related parameters

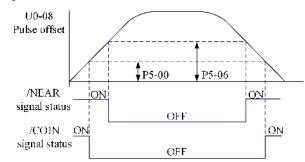

Parameter	Meaning	Default setting	Unit	Range	Change	Effective
P5-06	Near signal output width	655	Command unit	0~65535	Anytime	At once

Parameter	Signal name	Default setting	Suitable mode	Meaning	Modify	Effective
P5-46	/NEAR	n.0000	5 6	Positioning near	Anytime	At once
Refer to section 3.2.2 for hardware wiring details.						

If it is necessary to output from the SO2, P5-46 can be set to n.0002/0012.

1. Positioning approach signal output conditions

When the pulse deviation value U0-08 of the servo driver is lower than the P5-06 setting value, the positioning approach signal (/NEAR) is output.

2. Description of approach signal output

(1) The approach signal output width P5-06 changes proportionally due to the change of the electronic gear ratio. The default setting is 655 command units.

The following table is an example:

0		
The number of		
command pulses		T
required for one	Near signal output width	va
polar distance	P5-06	pi
during motor		T
operation		d
10000(default)	655(default)	sı
20000	1310	co
5000	327	d
3000	196	m
2000	131	1
1	1	-

The output width P5-06 of the proximity signal varies proportionally with the number of command pulses required to run one polar distance.

The output of the positioning completion signal depends on the positioning completion width. The smaller the width is, the later the positioning completion signal output is, but the signal output does not affect the actual operation state of the motor.

(2) The output width of the proximity signal can also be set separately, and its modification will not affect the number of command pulses required for the motor to operate at one polar distance.

(3) Please set this parameter larger than the positioning completion width.

5.4.1.4 Command pulse prohibition (/INHIBIT)

Position command prohibition, including internal and external position commands. Stop the function of command pulse input during position control. When the /INHIBIT signal is on, the pulse command is no longer counted.

Related parameters

Parameter	Signal name	Default setting	Suitable mode	Meaning	Modify	Effective
P5-32	/INHIBIT	n.0000	5 6	Command pulse prohibition	Anytime	At once
Parameter range n.0000-0017, assigned to other input terminals by parameter P5-32.						
If it is necessary to input from SI2, P5-32 can be set to n.0002/0012. Refer to section 3.2.1 for hardware						
wiring details.						

1. /INHIBIT terminal effectiveness description

Parameter setting Signal/INHIBIT terminal input status Signal/INHIBIT terminal			
	Parameter setting	Signal/INHIBIT terminal input status	Signal/INHIBIT terminal

status		logic
P5-32=n.0000	No external terminal input	
P5-32=n.000□	SI terminal has no signal input	Invalid
P5-32=n.001□	SI□ terminal has signal input	
P5-32=n.0010	No external terminal input	
P5-32=n.000□	SI□ terminal has signal input	Valid
P5-32=n.001□	SI□ terminal has no signal input	

2. The influence of /INHIBIT terminal signal on the running state of motor

	Motor operation status			
Control mode	/INHIBIT terminal logic valid	/INHIBIT terminal logic invalid		
5- internal position control	Pause current segment	/INHIBIT signal is from ON \rightarrow OFF, continue running from pause point.		
6- external pulse position control	Pause pulse command reception	/INHIBIT signal is from $ON \rightarrow OFF$, continue running from the pulse command received after OFF.		

5.4.1.5 Offset clear (/CLR)

Position offset=(position command - position feedback)(encoder unit)

The position deviation clearing function means that the driver can clear the position deviation when the servo is off or the /CLR signal is received.

Related parameters

Parameter	Signal name	Default setting	Suitable mode	Meaning	Modify	Effective		
P5-34	/CLR	n.0000	All	Pulse deviation clear	Anytime	At once		
Parameter range n.0000-0017, assigned to other input terminals by parameter P5-34.								

If it is necessary to input signal from SI2, P5-34 can be set to n.0002/0012. Refer to section 3.2.1 for hardware wiring details.

1. /CLR signal effectiveness

parameter setting status	Signal /CLR terminal input status	Signal /CLR terminal logic
P5-34=n.0000	No external terminal input	
P5-34=n.000□	SI terminal has no signal input	Invalid
P5-34=n.001□	SI terminal has signal input	
P5-34=n.0010	No external terminal input	
P5-34=n.000□	SI terminal has signal input	Valid
P5-34=n.001□	SI terminal has no signal input	

2. /CLR signal explanation

Send the pulse to the servo, execute the /CLR input signal, the servo will lock the current pulse counts, then update the current position of the encoder to the position feedback in the control, at the same time, clear the

intermediate quantity of the position loop, speed loop and current loop. /CLR signal is triggered by edge.

3. Other description of pulse position deviation clearing signal

Setting F0-02 to 1 can also clear the pulse position deviation.

5.4.1.6 Position pulse deviation

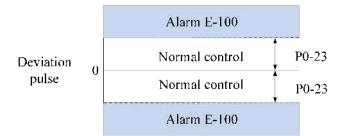

Pulse deviation value refers to the difference between command pulse of command controller (such as PLC) and feedback pulse of servo unit in position mode. Its unit is 1 command unit, which is related to the command unit determined by electronic gear ratio.

In position control, when the deviation pulse exceeds a certain limit value, an alarm will occur, and this threshold value is the deviation pulse limit value.

∎ F	elated parameters
-----	-------------------

parameter	Meaning	Default setting	Unit	Range	Change	Effective
P0-23	pulse deviation limit value	2000	0.01 polar distance	0~65535	Anytime	At once

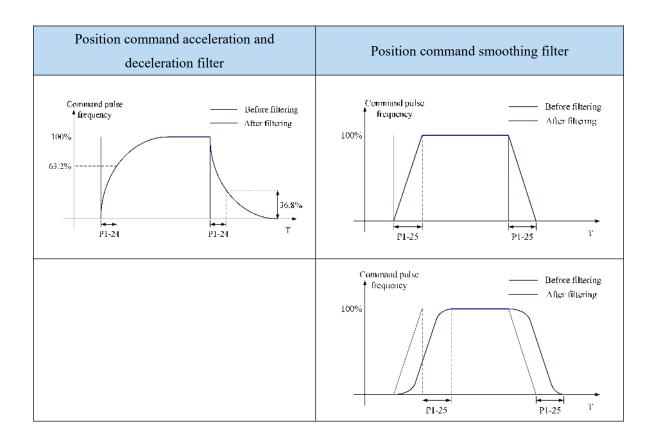

When the deviation pulse limit is 0, the deviation pulse will not be detected.

5.4.1.7 Position command filter

Related parameters

Parameter	Meaning	Default setting	Unit	Range	Change	Effective
P1-24	Position command acceleration and deceleration filtering time	0	0.1ms	0~65535	Servo OFF	At once
P1-25	Position command smoothing filtering time	0	0.1ms	0~65535	Servo OFF	At once

5.4.1.8 Reference origin

1. Find the reference origin

To find out the physical origin of working table and make it as the coordinates origin of point position control. Users can select finding reference origin at forward or reverse side.

Function setting:

Parameter	Meaning	Default setting	Unit	Range	Change	Effective		
P4-00 n.xx□x	Origin function	0	-	0~1	Servo OFF	At once		
Note: This function is applicable to position mode 5 and 6; when this parameter is set to 0, the function of Origin finding is invalid; when it is set to n 001x, the function of Origin finding can be								

function of Origin-finding is invalid; when it is set to n.001x, the function of Origin-finding can be used. (please set P9-21=0)

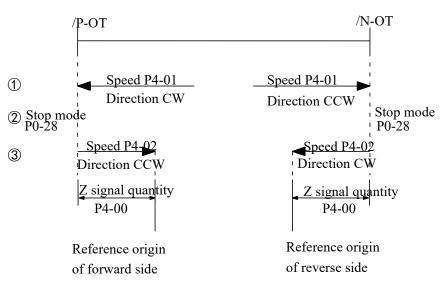

Signal setting

Parameter	Signal	Default	Meaning	Modify
			Mode 3: internal speed	Range: 0000-0017, distributes
D5 29	/SPD-A	<i>m</i> 0000	selecting signal	to input terminal through P5-28.
P5-28	/SPD-A	n.0000	Mode 5: find origin point at	When it set to 0001, it means
			forward direction	input signal from SI1.
			Mode 3: internal speed	Range: 0000-0017, distributes
P5-29	/SDD D	SPD-B n.0000 -	selecting signal	to input terminal through P5-29.
F J-29	/SPD-D		Mode 5: find origin point at	When it set to 0001, it means
			reverse direction	input signal from SI1.

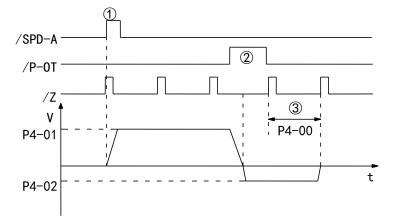

Related parameter setting:

Parameter	Meaning	Default setting	Unit	Range	Change	Effective
P4-00	Z phase signal	2	_	0~f	Servo	At once
n.xxx□	numbers	2		0 1	OFF	At once
P4-01	The speed hitting the proximity switch	600	rpm	0~65535	Servo OFF	At once
P4-02	The speed leaving the proximity switch	100	rpm	0~65535	Servo OFF	At once

Find reference origin diagram:

Sequential diagram of finding reference origin on forward side:

Steps:

(1) Install limit switch at forward and reverse side. At the rising edge of /SPD-A, motor runs forward at the speed of P4-01 to find the reference origin on forward side.

(2) After the working table hit the limit switch, the motor stop as the mode set by parameter P0-28

(3) Motor leaves the limit switch at the speed of P4-02. After the working table left the limit switch, the motor run at the Z phase signal position of No.n optical encoder. This position is considered as the coordinates origin, n is decided by parameter P4-00.

5.4.1.9 Homing function

1. Function overview

The return to origin function refers to that when the servo enable is on in the position control mode, after the return to origin function is triggered, the servo motor will find the origin and complete the positioning function. The found origin can be used as the position reference point for subsequent position control.

During the homing operation, other position commands (including the retriggered homing signal) are shielded. After the homing is completed, the servo driver can respond to other position commands.

After the homing is completed, the servo driver outputs the homing completion signal, and the upper computer can confirm that the homing has been completed after receiving the signal.

1. Parameter setting

	-					
Parameter	Name	Range	Meaning	Set time	Effective	Default
	Z phase		P9-11.0=0: not find Z phase P9-11.0=1: find one Z phase	Servo	Servo	
P9-11.0	numbers	0~F	P9-11.0=2: find two Z phases	OFF	ON	0
			And so on			
P9-11.1	Homing trigger mode	0~2	P9-11.1=0: not trigger homing P9-11.1=1: trigger homing through SI terminal (P5-28) P9-11.1=2: trigger homing after enabling	Servo OFF	Servo ON	0
P9-11.2	Homing mode	0~7	P9-11.2=0: homing mode 0 P9-11.2=1: homing mode 1 P9-11.2=2: homing mode 2 And so on	Servo OFF	Servo ON	0
P9-11.3	Deceleration mode when meeting the overlimit signal	0, 1	P9-11.3=0: decelerate as the setting of P9-14 P9-11.3=1: decelerate at once	Servo OFF	Servo ON	0

Note: P9-11.0 can set up to 15 Z phases. P9-11.1 = 0 means that the homing function cannot be used. This parameter can be understood as the enabling bit of the homing function. Homing modes 1, 3, 5 and 7 are the opposite situation of homing modes 0, 2, 4 and 6 respectively.

Parameter	Name	Range	Unit	Meaning	Set time	Effective	Default value
P9-12	Homing high speed	0~3000	mm/s	Return to the origin at high speed, find the deceleration point and execute the mechanical offset	Servo OFF	Servo ON	200
P9-13	Homing low speed	0~1000	mm/s	Homing with low speed. This low speed should be low enough not to cause mechanical shock when stopping	Servo OFF	Servo ON	20
P9-14	Homing acc/dec time	0~1000	ms	The acceleration and deceleration time here refers to the time required for 0 to 1000mm/s	Servo OFF	Servo ON	1000
P9-15	Maximum time allowed to return to the origin	0~12000	10ms	If the time spent in the whole process of homing exceeds the time set by this parameter, an alarm will be given. When P9-15 = 0, the timeout alarm will be shielded	Servo OFF	Servo ON	0
P9-16	Touch stop mode homing speed threshold	0~1000	mm/s	This parameter is only available for home mode 6 and 7	Servo OFF	Servo ON	2

Parameter	Name	Range	Unit	Meaning	Set time	Effective	Default value
P9-17	Touch stop mode homing torque threshold	0~300%	%	This parameter is only available for home mode 6 and 7 The base value of the percentage is the rated torque	Servo OFF	Servo ON	100%
P9-18	Touch stop mode homing time threshold	10~1500	ms	This parameter is only available for home mode 6 and 7	Servo OFF	Servo ON	500
P9-19	Quantitative pulses low bit	-9999~9999	-	Quantitative pulses low bit	Servo OFF	Servo ON	0
P9-20	Quantitative pulses high bit	-9999~9999	-	Quantitative pulses high bit	Servo OFF	Servo ON	0
P9-21	New/old homing function selection	0~2	-	P9-21=0: old homing function P9-21=1: new homing function P9-21=2: 402 standard homing function	Servo OFF	Power on again	2
Р9-22	New homing end filter time	50~10000	ms	When the homing is about to end, this filtering time is required. Wait until the motor stops completely before completely exiting the homing mode. After this filtering time, the return to origin completion signal will be output.	Servo OFF	Servo ON	500

Actual mechanical offset =P9-19 + P9-20 \times 10000, P9-19 and P9-20 need same symbol (all positive or negative value). The mechanical offset here is the absolute position of the servo after homing.

Parameter n.xxxx	Name	Meaning	Set time	Effective	Default
P5-22	Forward overtravel signal POT	Forward limit signal in homing mode	Operation setting	Take effect at once	0
P5-23	Reverse overtravel signal NOT	Reverse limit signal in homing mode	Operation setting	Take effect at once	0
P5-54	Homing completion signal	When the homing action and status are completed, the homing completion signal will be output. Even if other modes are executed after the homing is completed, the homing completion signal will not disappear. When the homing is started again, the homing completion signal will disappear.	Operation setting	Take effect at once	0

Parameter n.xxxx	Name	Meaning	Set time	Effective	Default
P5-64	Homing switch signal	The origin switch signal is required in the process of returning to the origin.	Operation setting	Take effect at once	0
P5-28	SI terminal start homing	When P9-11.1=1, P5-28 distributed the SI terminal, the homing can be triggered by SI terminal.	Operation setting	Take effect at once	0

1. New homing mode selection

To use the new homing function, first set **P9-21=1**, then set the overtravel switch (POT/NOT) and the origin switch. If the mechanical offset (P9-19 and P9-20 are set), please set the offset within the travel range to ensure that the mechanical equipment will not be damaged during the homing process!

The number of Z phases (P9-11.0) and the mechanical offset (P9-19, P9-20) can be valid at the same time. If the number of Z phases (P9-11.0) and the mechanical offset (P9-19, P9-20) are not set to 0, the servo will find the number of Z phases (P9-11.0) first, and then execute the mechanical offset (P9-19, P9-20). If the number of Z phases (P9-11.0) is 0 and the mechanical offset (P9-19, P9-20) is not 0, the servo does not find the Z phase, but executes the mechanical offset (P9-19, P9-20). If the number of Z phases is not 0 but the mechanical offset is 0, the servo will find the Z phase (P9-11.0) without performing the mechanical offset.

There are 8 homing modes in total, as follows:

(1) Positive homing, the deceleration point is the origin switch, and the origin is the origin switch or motor Z signal (P9-11.2 = 0)

(2) Reverse homing, the deceleration point is the origin switch, and the origin is the origin switch or motor Z signal (P9-11.2 = 1)

(3) Positive homing, the deceleration point and origin are motor Z signal (P9-11.2 = 2)

(4) Reverse homing, the deceleration point and origin are the motor Z signal (P9-11.2 = 3)

(5) Forward homing, the deceleration point is the forward overtravel switch, and the origin is the forward overtravel switch or motor Z signal (P9-11.2 = 4)

(6) Reverse homing, the deceleration point is the reverse overtravel switch, and the origin is the reverse overtravel switch or motor Z signal (P9-11.2 = 5)

(7) Positive homing, the deceleration point is the mechanical limit position, and the origin is the mechanical limit position or motor Z signal (P9-11.2 = 6)

(8) Reverse homing, the deceleration point is the mechanical limit position, and the origin is the mechanical limit position or motor Z signal (P9-11.2 = 7)

Each homing mode is analyzed in detail below:

1. Homing mode 0 — Positive homing, the deceleration point is the origin switch, and the origin is the origin switch or motor Z signal (P9-11.2 = 0)

To use this mode, you need to connect pot, not and origin switches.

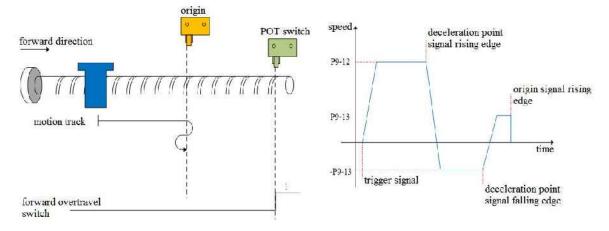

(1) When the motor starts to move, the signal of the origin switch (deceleration point) is invalid (P5-64 = 0-invalid, 1-valid), and the forward overtravel switch (POT) (P5-22) is not triggered in the whole process.

Firstly, the servo motor searches the deceleration point (origin) signal in the high-speed forward direction with the set value of P9-12 (homing high speed) until it meets the rising edge of the deceleration point (origin) signal. After gradually decelerating to -P9-13 (homing low speed) according to the setting of P9-14 (homing acceleration and deceleration time), the servo motor searches the deceleration point(origin) signal falling edge in the reverse direction at the low speed set by -P9-13 (homing low speed). When encountering the deceleration point (origin) signal falling edge, it will reverse, and continue to search the deceleration point (origin) signal rising edge at low speed with P9-13 (homing low speed). The next homing action can be divided into four cases:

(a) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is 0:

During the operation of continuing to search the rising edge of deceleration point (origin) signal at low speed with

P9-13 (homing low speed), stop immediately when encountering the rising edge of deceleration point (origin) signal.

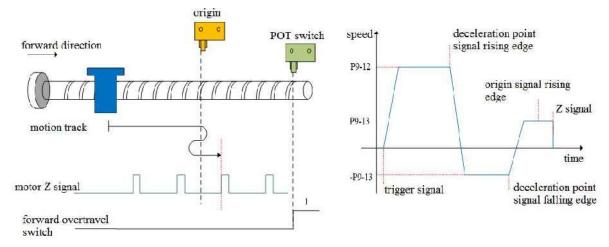

(b) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is not 0:

In the operation process of continuing to search the rising edge of deceleration point (origin) signal at low speed with P9-13 (homing low speed), stop immediately when encountering the rising edge of deceleration point (origin) signal. After the motor is completely stopped, the motor will move a quantitative pulse (P9-19, P9-20) with speed P9-12 (homing high speed) according to the set number of mechanical offset pulses and direction (either positive direction or negative direction), then the motor will stop.

(c) Z phase number (P9-11.0) is 1 and mechanical offset (P9-19, P9-20) is 0:

During the operation of continuing to search the rising edge of deceleration point (origin) signal at low speed P9-13 (homing low speed), continue to run after encountering the rising edge of deceleration point (origin) signal, and then find the first Z-phase signal and stop immediately.

(d) Z phase number (P9-11.0) is 1 and mechanical offset (P9-19, P9-20) is not 0:

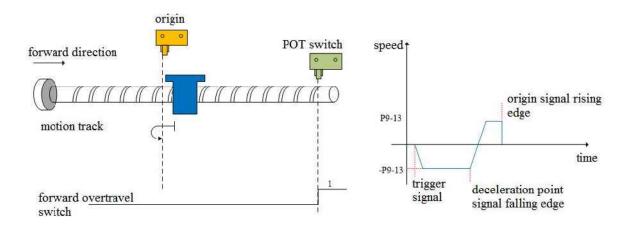

During the operation of continuing to search the rising edge of the deceleration point (origin) signal at low speed P9-13 (homing low speed), continue to run after encountering the rising edge of the deceleration point (origin) signal, then find the first z-phase signal and stop immediately. After the motor is completely stopped, according to the set number of mechanical offset pulses (P9-19, P9-20) and direction (it can be positive direction or negative direction), the motor goes through a quantitative pulses (P9-19, P9-20) at the speed set by P9-12 (homing high speed), and then the motor stops.

(2) When the motor starts to move, the origin switch (deceleration point) signal is valid (P5-64 = 0-invalid, 1-valid), and the forward overtravel switch (P5-22) is not triggered in the whole process:

The servo motor directly searches for the falling edge of the deceleration point (origin) signal at low speed -P9-13 (homing low speed). If it encounters the falling edge of the deceleration point (origin) signal, it will reverse (i.e. forward), and continue to search for the rising edge of the deceleration point (origin) signal at low speed with P9-13 (homing low speed). The next homing action can be divided into four cases:

(a) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is 0:

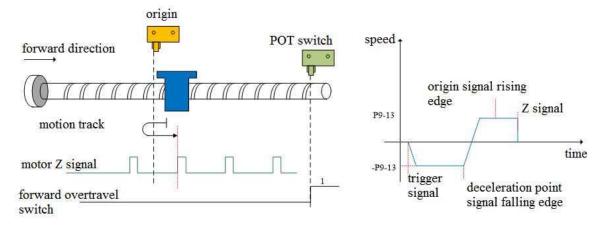

In the process of forward acceleration or forward constant speed operation, stop immediately when encountering the rising edge of deceleration point (origin) signal.

(b) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is not 0:

In the process of positive acceleration or positive constant speed operation, stop immediately after encountering the rising edge of the origin signal. After the motor is completely stopped, according to the set number of mechanical offset pulses and direction (either positive or negative direction), the motor will move a quantitative pulse (P9-19, P9-20) at the speed set by P9-12 (homing high speed), and then the motor will stop. (c) Z phase number (P9-11.0) is 1 and mechanical offset (P9-19, P9-20) is 0:

In the process of forward acceleration or forward constant speed operation, continue to run after encountering the rising edge of the origin signal, and then find the first Z-phase signal and stop immediately.

(d) Z phase number (P9-11.0) is 1 and mechanical offset (P9-19, P9-20) is not 0:

In the process of positive acceleration or positive constant speed operation, continue to run after encountering the rising edge of the origin signal, and then find the first Z-phase signal and stop immediately. After the motor is completely stopped, the motor will run a quantitative pulse (P9-19, P9-20) at the set speed P9-12 (homing high speed) according to the set number of mechanical offset pulses (P9-19, P9-20) and direction (either positive or negative direction), then the motor stops.

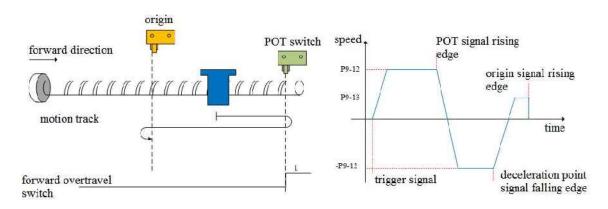

(3) When the motor starts to move, the signal of the origin switch (deceleration point) is invalid (P5-64 =

0-invalid, 1-valid), and the forward overtravel switch (P5-22) triggered in the process is valid.

Firstly, the servo motor forward searches for the deceleration point signal at high speed P9-12 (homing high speed). After encountering the forward overtravel switch (POT) (P5-22), the driver immediately reverse searches for the falling edge of the deceleration point (origin) signal at the speed -P9-12 (homing high speed) according to the value set by P9-14 (homing acceleration and deceleration time). After encountering the falling edge of the deceleration point (origin) signal, decelerate in the reverse direction (i.e. restore the forward direction) according to the set value of P9-14 (homing acceleration and deceleration time). The servo motor forward searches the rising edge of the deceleration point (origin) signal at low speed of P9-13 (homing low speed). The next action back to the origin can be divided into four cases:

(a) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is 0:

In the process of forward acceleration or forward constant speed operation, stop immediately when encountering the rising edge of the origin signal.

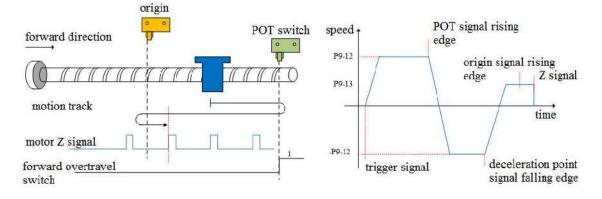

(b) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is not 0:

In the process of positive acceleration or positive constant speed operation, stop the machine immediately after encountering the rising edge of the deceleration point (origin) signal. After the motor is completely stopped, the motor will move a quantitative pulse (P9-19, P9-20) at the speed set by P9-12 (homing high speed) according to the set number and direction of mechanical offset pulses (either positive direction or negative direction), then the motor stops.

(c) Z phase number (P9-11.0) is 1 and mechanical offset (P9-19, P9-20) is 0:

In the process of forward acceleration or forward constant speed operation, continue to run after encountering the rising edge of deceleration point (origin) signal, and then find the first Z-phase signal and stop immediately.

(d) Z phase number (P9-11.0) is 1 and mechanical offset (P9-19, P9-20) is not 0:

In the process of positive acceleration or positive constant speed operation, continue to run after encountering the rising edge of the deceleration point (origin) signal, and then find the first Z-phase signal to stop immediately.

After the motor is completely stopped, the motor will run a quantitative pulse (P9-19, P9-20) at the set speed P9-12 (homing high speed) according to the set number of mechanical offset pulses and direction (either positive direction or negative direction), then the motor stops.

2. Homing mode 1——Reverse return to zero, the deceleration point is the origin switch, and the origin is the origin switch or motor Z signal (P9-11.2=1)

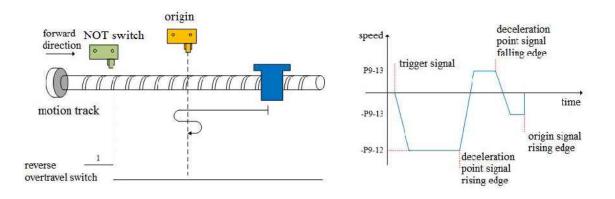

It needs to connect POT, NOT, origin switch to use this mode.

(1) When the motor starts to move, the signal of origin switch (deceleration point) is invalid, and the reverse overtravel switch (NOT)(P5-23) is not triggered in the whole process

Firstly, the servo motor searches for the deceleration point signal at high speed -P9-12 (homing high speed) in reverse until it meets the rising edge of the deceleration point signal. After gradually accelerating to P9-13 (homing low speed) according to the setting of P9-14 (homing acceleration and deceleration time), the servo motor forward searches for the falling edge of deceleration point (origin) signal at the low speed P9-13 (homing low speed). When encountering the falling edge of deceleration point (origin) signal, it will reverse (resume reverse), and continue to search the rising edge of the deceleration point (origin) signal at a low speed -P9-13(homing low speed). The next back to origin action can be divided into four cases:

(a) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is 0:

During the operation of continuing to search for the rising edge of deceleration point (origin) signal at low speed -P9-13 (homing low speed), stop immediately when encountering the rising edge of deceleration point (origin) signal.

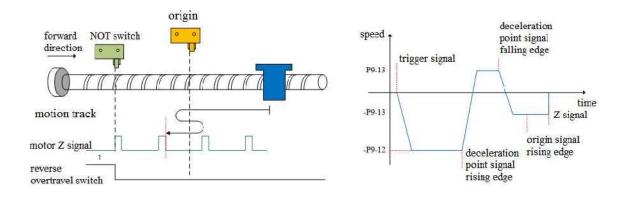

(b) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is not 0:

During the operation of continuing to search the rising edge of deceleration point (origin) signal at low speed -P9-13 (homing low speed), stop the machine immediately after encountering the rising edge of deceleration point (origin) signal. After the motor is completely stopped, the motor will run a quantitative pulse (P9-19, P9-20) at the set speed P9-12 (homing high speed) according to the set number of mechanical offset pulses and direction (either positive direction or negative direction), then the motor stops.

(c) Z phase number (P9-11.0) is 1 and mechanical offset (P9-19, P9-20) is 0:

During the operation of continue to search the rising edge of deceleration point (origin) signal at low speed -P9-13 (homing low speed), continue to run after encountering the rising edge of deceleration point (origin) signal, and then find the first Z-phase signal and stop immediately.

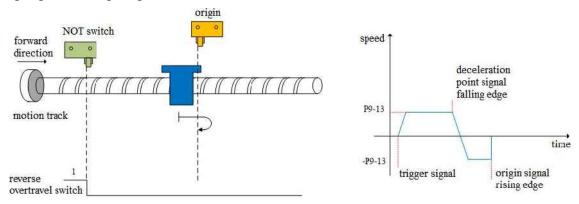

During the operation of continue to search the rising edge of the deceleration point (origin) signal at low speed -P9-13 (homing low speed), continue to operate after encountering the rising edge of the deceleration point (origin) signal, then find the first Z-phase signal and stop immediately. After the motor stops completely, according to the set number of mechanical offset pulses and direction (either positive direction or negative direction), the motor goes through a quantitative pulse (P9-19, P9-20) at the speed P9-12 (homing high speed), and then the motor stops.

(2) When the motor starts to move, the signal of origin switch (deceleration point) is valid (P5-64 = 0-invalid, 1-valid), and the reverse overtravel switch is not triggered in the whole process (NOT) (P5-23).

The servo motor directly forward searches for the falling edge of the deceleration point (origin) signal at low speed P9-13 (homing low speed). If it encounters the falling edge of the deceleration point (origin) signal, it will reverse (i.e. negative direction), and continue to search for the rising edge of the deceleration point (origin) signal at low speed -P9-13 (homing low speed). The next action of returning to origin can be divided into four cases: (a) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is 0:

In the process of negative acceleration or negative constant speed operation, stop immediately when encountering the rising edge of the origin signal.

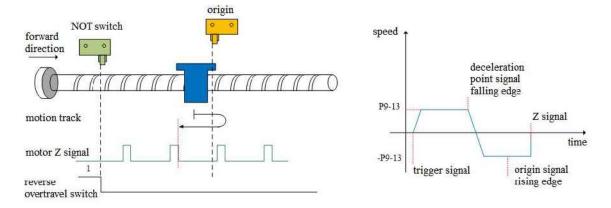

(b) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is not 0:

In the process of negative acceleration or negative constant speed operation, stop the machine immediately after encountering the rising edge of the origin signal. After the motor is completely stopped, the motor will walk a quantitative pulse (P9-19, P9-20) at the speed P9-12 (homing high speed) according to the set number and direction of mechanical offset pulses (either positive direction or negative direction), and then stop the motor.

(c) Z phase number (P9-11.0) is 1 and mechanical offset (P9-19, P9-20) is 0:

During negative acceleration or negative constant speed operation, continue operation after encountering the

rising edge of deceleration point (origin) signal, and then stop immediately after finding the first Z-phase signal.

(d) Z phase number (P9-11.0) is 1 and mechanical offset (P9-19, P9-20) is not 0:

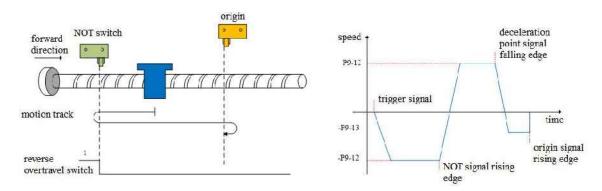

In the process of negative acceleration or negative constant speed operation, continue to operate after encountering the rising edge of the deceleration point (origin) signal, and then find the first Z-phase signal to stop immediately. After the motor stops completely, the motor will run a quantitative pulse (P9-19, P9-20) at the set speed P9-12 (homing high speed) according to the set mechanical offset pulse numbers and direction (either positive or negative direction), then the motor stops.

(3) When the motor starts to move, the signal of the origin switch (deceleration point) is invalid (P5-64 = 0-invalid, 1-valid), and the reverse overtravel switch triggered in the process is valid (NOT) (P5-23).

Firstly, the servo motor reverse searches for the deceleration point (origin) signal at high speed -P9-12 (homing high speed). After encountering the reverse overtravel switch (NOT), the driver decelerates in reverse (i.e. forward) according to the value set in P9-14 (homing acceleration and deceleration time), and immediately searches for the falling edge of the deceleration point (origin) signal at high speed P9-12 (homing high speed) in the forward direction. After encountering the falling edge of the deceleration point (origin) signal, decelerate in the reverse direction (i.e. negative direction) according to the set value of P9-14 (homing acceleration and deceleration point (origin) signal in the reverse low speed -P9-13 (homing low speed). The next homing action can be divided into four cases:

(a) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is 0:

In the process of reverse acceleration or reverse constant speed operation, stop immediately when encountering the rising edge of the origin signal.

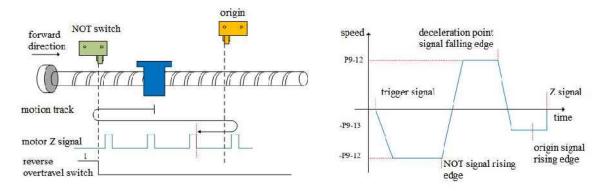

(b) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is not 0:

In the process of reverse acceleration or reverse constant speed operation, stop the machine immediately after

encountering the rising edge of the deceleration point (origin) signal. After the motor is completely stopped, the motor will move a quantitative pulse (P9-19, P9-20) at the speed set by P9-12 (homing high speed) according to the set number and direction of mechanical offset pulses (either positive direction or negative direction), then the motor stops.

(c) Z phase number (P9-11.0) is 1 and mechanical offset (P9-19, P9-20) is 0:

In the process of reverse acceleration or reverse constant speed operation, continue the operation after encountering the rising edge of the origin signal, and then stop immediately after finding the first Z-phase signal.

(d) Z phase number (P9-11.0) is 1 and mechanical offset (P9-19, P9-20) is not 0:

In the process of reverse acceleration or reverse constant speed operation, continue to operate after encountering the rising edge of the deceleration point (origin) signal, and then find the first Z-phase signal to stop immediately. After the motor is completely stopped, the motor will run a quantitative pulse (P9-19, P9-20) at the set speed P9-12 (homing high speed) according to the set number of mechanical offset pulses and direction (either positive direction or negative direction), then the motor stops.

3. Homing mode 2—forward homing, deceleration point and origin are motor Z signal (P9-11.2=2)

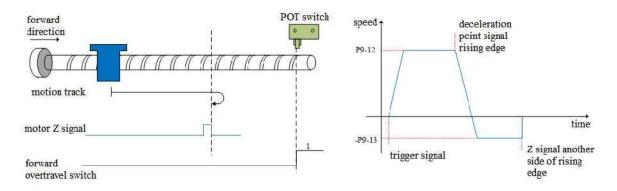

In this mode, the number of Z phases of the motor is not found. To use this mode, you need to connect POT and NOT.

(1) When the motor starts to move, the Z signal is invalid or valid (P5-64 = 0-invalid, 1-valid), and the forward overtravel switch (POT) is not triggered in the whole process.

Firstly, the servo motor forward searches the Z signal at the high-speed P9-12 (homing high speed). After encountering the rising edge of the Z signal, it decelerates in the reverse direction according to the set value of P9-14 (homing acceleration and deceleration time), accelerates to -P9-13 (homing low speed) and reverse searches the Z signal at low speed. Next, the homing action is divided into two cases:

(a) Mechanical offset (P9-19, P9-20) is 0:

In the process of reverse acceleration or reverse constant speed operation, stop immediately when encountering the rising edge of the other side of the motor Z signal.

(b) Mechanical offset (P9-19, P9-20) is not 0:

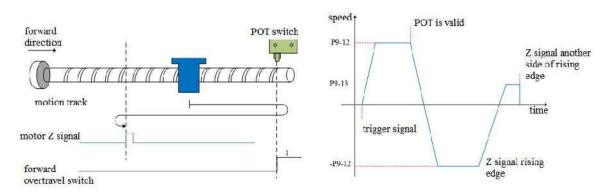

In the process of reverse acceleration or reverse constant speed operation, stop immediately when encountering the rising edge on the other side of the motor Z signal. After the motor is completely stopped, the motor will walk a quantitative pulse (P9-19, P9-20) at the speed set by P9-12 (homing high speed) according to the set number and direction of mechanical offset pulses (either positive direction or negative direction), then the motor stops.

(2) When the motor starts to move, the Z signal is invalid or valid (P5-64 = 0-invalid, 1-valid), and the forward overtravel switch is triggered in the process (POT) (P5-22).

Firstly, the servo motor searches for the Z signal in forward direction with the high speed P9-12 (homing high-speed speed). After encountering the forward overtravel switch, the driver decelerates in the reverse direction according to P9-14 (homing acceleration and deceleration time), and searches for the Z signal in the reverse direction with the high-speed -P9-12 (homing high-speed) until encountering the rising edge of the Z signal. The machine gradually decelerates in the reverse direction (i.e. returns to the forward direction) according to P9-14 (homing acceleration time). The servo motor searches the rising edge of the other side of the Z signal in the forward direction and low speed P9-13 (homing low speed). The next homing action is divided into two cases:

(a) Mechanical offset (P9-19, P9-20) is 0:

In the process of forward acceleration or forward constant speed operation, stop immediately when encountering the rising edge of the other side of the Z signal.

(b) Mechanical offset (P9-19, P9-20) is not 0:

In the process of positive acceleration or positive constant speed operation, stop immediately when encountering the rising edge on the other side of the motor Z signal. After the motor is completely stopped, the motor will walk a quantitative pulse at the speed set by P9-12 (homing high speed) according to the set number of mechanical offset pulses and direction (either positive direction or negative direction), and then stop the motor.

4. Homing mode 3—reverse homing, the deceleration point and origin are motor Z signal (P9-11.2=3)

In this mode, the number of Z phases of the motor is not found. To use this mode, you need to connect POT and NOT.

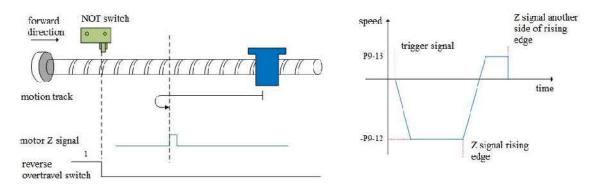

(1) When the motor starts to move, the Z signal is invalid or valid (P5-64 = 0-invalid, 1-valid), and the reverse overtravel switch is not triggered in the whole process (NOT).

Firstly, the servo motor searches for the Z signal in reverse direction with the high speed -P9-12 (homing high speed). After encountering the rising edge of the Z signal, it decelerates and reverses according to the set value of P9-14 (homing acceleration and deceleration time), accelerates to P9-13 (homing low speed) and searches for the Z signal at low speed in forward direction. Next, the homing action is divided into two cases:

(a) Mechanical offset (P9-19, P9-20) is 0:

In the process of forward acceleration or forward constant speed operation, stop immediately when encountering

the rising edge of the other side of the motor Z signal.

(b) Mechanical offset (P9-19, P9-20) is not 0:

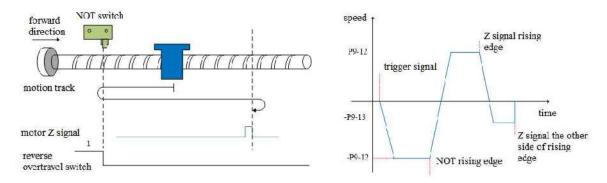

In the process of positive acceleration or positive constant speed operation, stop the machine immediately when encountering the rising edge on the other side of the motor Z signal. After the motor is completely stopped, the motor will walk a quantitative pulse (P9-19, P9-20) at the speed set by P9-12 (homing high speed) according to the set number and direction of mechanical offset pulses (either positive direction or negative direction), then the motor stops.

(2) When the motor starts to move, the Z signal is invalid or valid (P5-64 = 0-invalid, 1-valid), and the reverse overtravel switch is triggered in the process (NOT)

The servo motor searches for the Z signal at high speed -P9-12 (homing high speed) in reverse direction. After encountering the reverse overtravel switch, the driver decelerates and reverses according to P9-14, and then searches for the Z signal at high speed P9-12 (homing high speed) in forward direction until encountering the rising edge of the Z signal, and gradually decelerates and reverses (i.e. restores the reverse direction) according to the set value of P9-14 (homing acceleration and deceleration time). The servo motor searches the rising edge on the other side of the Z signal at low speed -P9-13 (homing low speed) in reverse direction. Next, the homing action is divided into two cases:

(a) Mechanical offset (P9-19, P9-20) is 0:

In the process of reverse acceleration or reverse constant speed operation, stop immediately when encountering the rising edge of the other side of the Z signal.

(b) Mechanical offset (P9-19, P9-20) is not 0:

In the process of reverse acceleration or reverse constant speed operation, stop immediately when encountering the rising edge on the other side of the motor Z signal. After the motor is completely stopped, the motor will walk a quantitative pulse (P9-19, P9-20) at the speed set by P9-12 (homing high speed) according to the set number and direction of mechanical offset pulses (either positive direction or negative direction), then the motor stops.

5. Homing mode 4—forward homing, deceleration point and origin are forward overtravel switch POT

(P5-22) (P9-11.2=4)

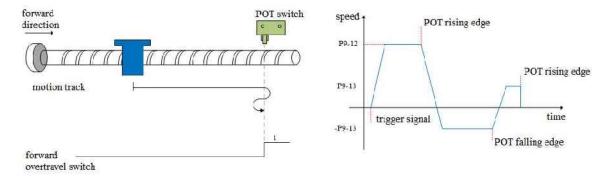

To use this mode, it needs to connect NOT, POT.

(1) When the motor starts moving, the forward overtravel switch (POT) is invalid

Firstly, the servo motor searches the forward overtravel switch at high speed P9-12 (homing high speed). After encountering the rising edge of the forward overtravel switch signal, it gradually decelerates in reverse according to the setting of P9-14 (homing acceleration and deceleration time). The servo motor searches the falling edge of the forward overtravel switch signal in reverse direction at low speed -P9-13 (homing low speed). After encountering the falling edge of the forward overtravel switch signal, the next action of returning to the origin can be divided into four cases:

(a) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is 0:

Decelerate in the reverse direction (i.e. restore the forward direction), and search for the rising edge of the forward overtravel switch signal in the forward direction and low speed P9-13 (homing low speed). In the process of forward acceleration or forward constant speed operation, stop immediately when encountering the rising edge of the forward overtravel switch signal.

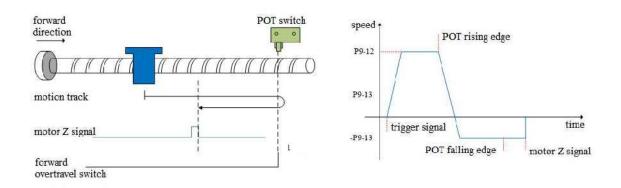

(b) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is not 0:

Decelerate in the reverse direction (i.e. restore the forward direction), and search the rising edge of the forward overtravel switch signal in the forward with low speed P9-13 (homing low speed). In the process of forward acceleration or forward uniform speed operation, stop immediately when encountering the rising edge of the forward overtravel switch signal. After the motor is completely stopped, motor walks a quantitative pulse at the speed set by P9-12 (homing high speed) according to the set number and direction of mechanical offset pulses (it can only be in the negative direction, that is, it must move between the origin switch and NOT), and then the motor will stop.

(c) Z phase number (P9-11.0) is 1 and mechanical offset (P9-19, P9-20) is 0:

Continue to operate in reverse at the low speed set by -P9-13 (homing low speed), and then stop immediately after encountering the rising edge of the first Z-phase signal.

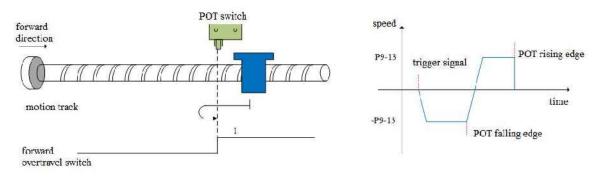

Continue to operate in the reverse direction at the low speed set by -P9-13 (homing low speed), and then stop immediately after encountering the rising edge of the first Z-phase signal. After the motor stops completely, the motor will move a quantitative pulse at the speed P9-12 (homing high speed) according to the set number of mechanical offset pulses and direction (it can be negative or positive, but it must move between the origin switch and NOT), and then the motor stops.

(2) Forward overtravel switch is valid when motor starts moving (POT) (P5-22)

The servo motor directly searches for the falling edge of the forward overtravel switch signal (POT) at a reverse low speed -P9-13 (homing low speed). After encountering the falling edge of POT, the next homing action is divided into four cases:

(a) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is 0:

Decelerate in the reverse direction (i.e. restore the forward direction), search for the rising edge of POT in the forward low-speed P9-13 (homing low speed), and stop immediately when encountering the rising edge of POT during forward acceleration or forward constant speed operation.

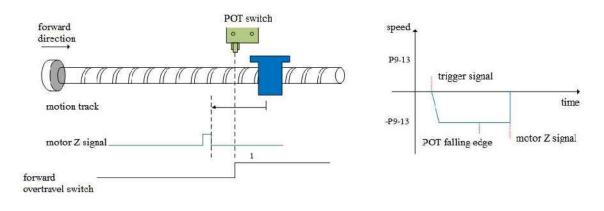

(b) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is not 0:

Decelerate in reverse direction (i.e. restore the positive direction), search the rising edge of POT at low speed and positive direction with P9-13 (homing low speed). In the process of positive acceleration or positive constant speed operation, stop immediately when encountering the rising edge of POT. After the motor stops completely, the motor will move a quantitative pulse at the speed P9-12 (homing high speed) according to the set number of mechanical offset pulses and direction (it only can be negative direction, but it must move between the origin switch and NOT), and then the motor stops.

(c) Z phase number (P9-11.0) is 1 and mechanical offset (P9-19, P9-20) is 0:

Continue to operate in reverse at the low speed -P9-13 (homing low speed), and then stop immediately after encountering the rising edge of the first Z-phase signal.

Continue to operate in the reverse direction at the low speed -P9-13 (homing low speed), and then stop immediately after encountering the rising edge of the first Z-phase signal. After the motor stops completely, the motor will move a quantitative pulse at the speed P9-12 (homing high speed) according to the set number of mechanical offset pulses and direction (it can be negative or positive, but it must move between the origin switch and NOT), and then the motor stops.

6. Homing mode 5—reverse homing, deceleration point and origin are reverse overtravel switch NOT (P5-23) (P9-11.2=5)

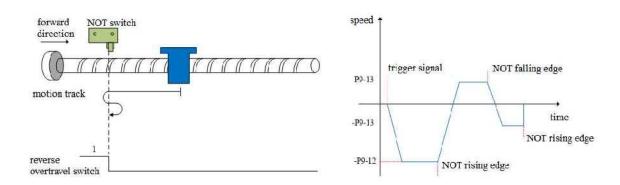

To use this mode, please connect POT, NOT.

(1) When the motor starts moving, the reverse override switch (NOT) is invalid

Firstly, the servo motor searches for the reverse overtravel switch (NOT) at reverse high speed -P9-12 (homing high speed). After encountering the rising edge of NOT, it gradually decelerates in reverse according to the setting of P9-14 (homing acceleration and deceleration time). The servo motor searches for the falling edge of NOT at forward low speed P9-13 (homing low speed). After encountering the falling edge of NOT, the next homing action can be divided into four cases:

(a) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is 0:

Decelerate in the reverse direction (i.e. restore the reverse direction), and search for the rising edge of NOT at the reverse low speed -P9-13 (homing low speed). In the process of reverse acceleration or reverse constant speed operation, stop immediately when encountering the rising edge of NOT.

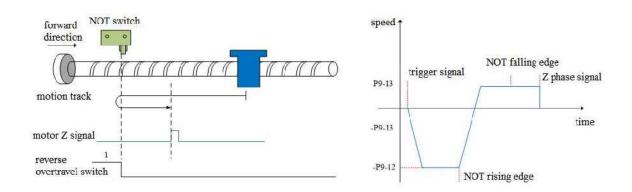

(b) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is not 0:

Decelerate in the reverse direction (i.e. restore the reverse direction), and search for the rising edge of the reverse overtravel switch signal (NOT) at the reverse low speed -P9-13 (homing low speed). In the process of reverse acceleration or reverse constant speed operation, stop immediately when encountering the rising edge of NOT. After the motor stops completely, the motor will move a quantitative pulse at the speed P9-12 (homing high speed) according to the set number of mechanical offset pulses and direction (it only can be positive, but it must move between the origin switch and POT), and then the motor stops.

(c) Z phase number (P9-11.0) is 1 and mechanical offset (P9-19, P9-20) is 0:

Continue to operate in the forward low-speed P9-13, and then stop immediately after encountering the rising edge of the first Z-phase signal.

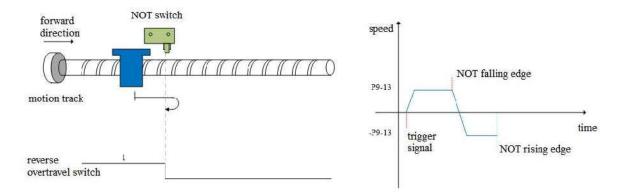

Continue to operate in the forward low-speed P9-13, and then stop immediately after encountering the rising edge of the first Z-phase signal. After the motor stops completely, the motor will move a quantitative pulse at the speed P9-12 (homing high speed) according to the set number of mechanical offset pulses and direction (it can be positive or negative), but it must move between the origin switch and POT), and then the motor stops.

(2) When the motor starts to move, the reverse overtravel switch (NOT) (P5-23) is valid

The servo motor directly searches for the falling edge of the reverse overtravel switch signal (NOT) at the forward low speed P9-13 (homing low speed). After encountering the falling edge of NOT, the next homing action is divided into four cases:

(a) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is 0:

Decelerate in reverse direction (i.e. resume reverse direction), search for the rising edge of NOT in reverse direction at low speed -P9-13(homing low speed). During reverse acceleration or reverse constant speed operation, stop immediately when encountering the rising edge of NOT.

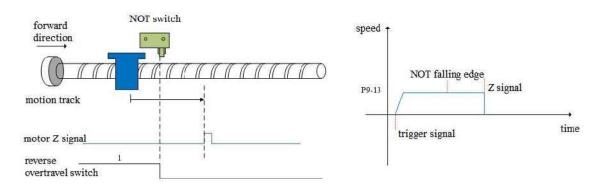

(b) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is not 0:

Decelerate in reverse direction (i.e. recover in reverse direction), search for the rising edge of NOT in reverse direction at low speed -P9-13 (homing low speed). During reverse acceleration or reverse constant speed operation, stop immediately when encountering the rising edge of NOT. After the motor stops completely, the motor will move a quantitative pulse at the speed P9-12 (homing high speed) according to the set number of mechanical offset pulses and direction (it only can be positive), but it must move between the origin switch and POT), and then the motor stops.

(c) Z phase number (P9-11.0) is 1 and mechanical offset (P9-19, P9-20) is 0:

Continue to operate at the forward low speed P9-13 (homing low speed), and then stop immediately after encountering the rising edge of the first Z-phase signal.

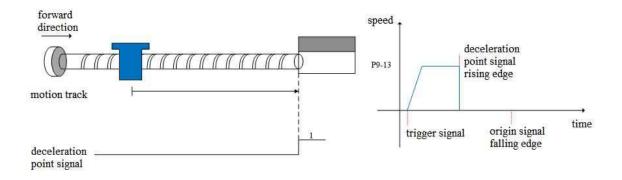

Continue to operate at the forward low speed P9-13 (homing low speed), and then stop immediately after encountering the rising edge of the first Z-phase signal. After the motor stops completely, the motor will move a quantitative pulse at the speed P9-12 (homing high speed) according to the set number of mechanical offset pulses and direction (it can be positive or negative, but it must move between the origin switch and POT), and then the motor stops.

7. Homing mode 6——forward homing, deceleration point and origin are forward mechanical limit position (P9-11.2=6)

To use this mode, no need to connect POT, NOT and origin switch.

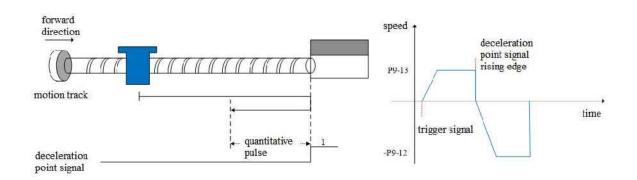

Firstly, the servo motor runs forward at low speed P9-13 (homing low speed). After hitting the mechanical limit position, if the absolute value of torque reaches the upper torque limit of P9-17 (touch stop homing mode torque threshold), and the absolute value of speed is lower than the set value of P9-16 (touch stop homing mode speed threshold), this state remains P9-18 (touch stop homing mode time threshold) After the set time, it is judged that the mechanical limit position is reached, and the next homing action can be divided into four cases:

(a) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is 0: Shut down immediately.

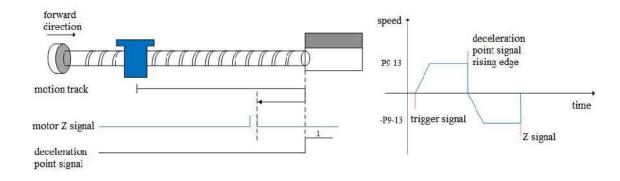

(b) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is not 0:

The servo motor stops immediately. After it stops completely, according to the set number of mechanical offset pulses, the motor reverse moves a quantitative pulse (P9-19, P9-20) at the speed set by -P9-12 (homing high speed), and then the motor stops.

(c) Z phase number (P9-11.0) is 1 and mechanical offset (P9-19, P9-20) is 0:

Operate in reverse at the low speed set by -P9-13 (homing low speed), and then stop immediately after encountering the rising edge of the first Z-phase signal.

(d) Z phase number (P9-11.0) is 1 and mechanical offset (P9-19, P9-20) is not 0:

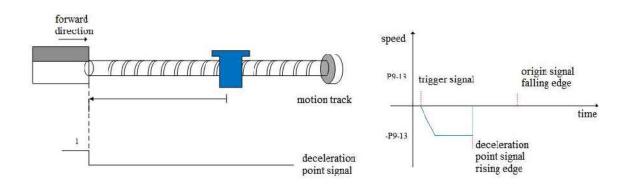

Run in reverse at the low speed set by -P9-13 (homing low speed), then stop immediately after encountering the rising edge of the first Z-phase signal, and then walk a quantitative pulse (it can run in positive direction or negative direction, but it must be within the mechanical limit position) at the speed set by -P9-12 (homing high speed) according to the set number of mechanical offset pulses after complete stop, and then the motor stops.

8. Homing mode 7—reverse homing, deceleration point and origin are reverse mechanical limit position (P9-11.2=7)

To use this mode, no need to connect POT, NOT and origin switch.

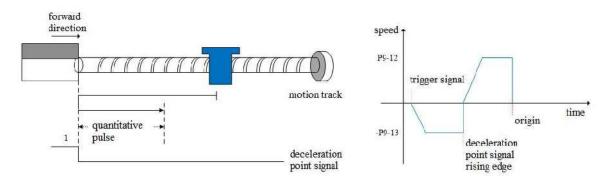

Firstly, the servo motor runs in reverse direction with the low speed -P9-13 (homing low speed). After hitting the mechanical limit position, if the absolute value of torque reaches the upper torque limit of P9-17 (touch stop homing mode torque threshold), and the absolute value of speed is lower than the set value of P9-16 (touch stop homing mode speed threshold), this state remains P9-18 (touch stop homing mode time threshold). After the set time, it is judged that the mechanical limit position is reached, and the next action of returning to the origin can be divided into four cases:

(a) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is 0: Shut down immediately.

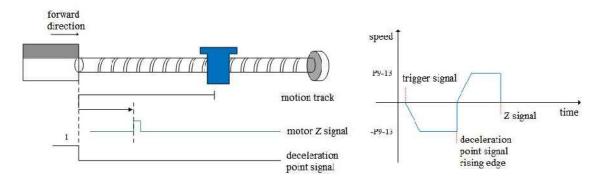

(b) Z phase number (P9-11.0) is 0 and mechanical offset (P9-19, P9-20) is not 0:

The servo motor stops immediately. After it stops completely, the motor moves forward a quantitative pulse (P9-19, P9-20) at the speed set by P9-12 (high speed back to the origin) according to the set number of mechanical offset pulses, and then the motor stops.

(c) Z phase number (P9-11.0) is 1 and mechanical offset (P9-19, P9-20) is 0:

Operate in the forward direction at the low speed P9-13 (homing low speed), and then stop immediately after encountering the rising edge of the first Z-phase signal.

(d) Z phase number (P9-11.0) is 1 and mechanical offset (P9-19, P9-20) is not 0:

Operate in the forward direction with low-speed P9-13 (homing low-speed), and then stop immediately after encountering the rising edge of the first Z-phase signal. After complete stop, the motor will walk a fixed pulse (P9-19, P9-20) at the speed set by P9-12 (homing high-speed) according to the set number of mechanical offset pulses (it can operate in positive direction or negative direction, but it must be within the mechanical limit position), and then the motor stops.

Note: only for homing mode 6 and 7.

For homing modes 6 and 7, once these two homing modes are triggered, the maximum torque during homing is 1.1 times of the set value of P9-17 (touch stop homing torque threshold). If the internal forward and reverse torque

limits P3-28 and P3-29 are smaller than 1.1 times of the set value of P9-17 (touch stop homing torque threshold), the torque limit is the set value of P3-28 and P3-29. Similarly, if the external forward and reverse torque limits P3-30 and P3-31 are enabled, the actual torque limit is the minimum of the internal torque limit, the external torque limit and 1.1 times of the P9-17 set value.

Only when these two homing modes are triggered, 1.1 times of the set value of torque limit P9-17 (touch stop homing torque threshold) will take effect. If only the homing is enabled and (homing mode) P9-11.2 is 6 or 7, but the homing is not triggered, 1.1 times of the set value of torque limit P9-17 (touch stop homing torque threshold) will not take effect.

5.4.1.10 Upper computer homing function (CIA402)

■ Function description:

402 standard homing function in non ECAT mode of linear drive DL6.

1. In non ECAT mode and position control mode, when P9-21 is set to 2, it can homing in the following ways:

(1) P9-41.1=1, trigger the homing through the SI terminal.

(2) P9-41.1=2, the first power on enable will automatically trigger the homing.

(3) P9-41.1=3, set F2-08=1, trigger homing. Set F2-08 to 2 to stop homing (F2-08 only supports writing through communication).

2. During the homing operation, other position commands (including the triggered homing signal) are blocked. After the homing is completed, the servo drive can respond to other position commands.

3. The homing mode is the same as the bus HM mode (except for the 35 and 37 modes), refer to the "EtherCAT Bus Control Mode ->HM Mode ->Homing Mode" section of the manual, and reference chapter: 7.5.3 HM Mode.

Parameter	Name	Setting range	Meaning	Setting time	Effective time	Default value

0: CW/CCW	CCW OFF	
0: Cw/CCw	cw	CW OFF
1: AB	90°	90° ->
	Phase B	Phase B
2: P+D	pulse	pulse
2: P+D	direction ON	direction OFF

5.4.2.5 Pulse command forward direction selection

Parameter	Meaning	Default setting	Unit	Range	Change	Effective		
P0-09.0	forward direction	0	- 0/1	0/1	Servo	Re-power		
n.xxx□	n.xxx of pulse instruction	0		0/1	OFF	on		
P0-09 will change the counting direction of the internal counter in the servo system. The counting								
direction determines the rotation direction of the motor. Therefore, this parameter can be adjusted if								
the actual ro	the actual rotation direction of the motor is different from the expected direction in the position mode.							

Parameter	Meaning	Default setting	Unit	Range	Change	Effective
P0-09.2 n.x□xx	Pulse command filter time	0	ns	0~4	Servo OFF	Re-power on

1.24V pulse: The pulse command filtering time can only be set to 3/4, and the pulse filtering time can enhance the anti-interference ability of low-speed pulses (within 200K).

2.5V differential pulse: When using 4M frequency pulse input, the pulse command filtering time can only be set to 0.

P0-09.2 = 0: Turn off the noise filter.

P0-09.2 = $1 \sim 4$: Turn on the noise filter with a filtering time of $4^{(n-1)/clk(ns)}$. Clk=50m (ns) in speed mode and 100m (ns) in position mode.

In AB phase input mode, the maximum receiving frequency hardware design is 4M, which means that for an encoder with a resolution of 1um, the maximum speed should not exceed 4M/s.

5.4.3 Position control (Internal command)

1. waiting mode

8						
n.x□xx	l	Meaning				
0	Wait	for positioning completion				
1	Not wa	ait for positioning completion				
Note: Waiting mod	e refers to whether the driver wa	aits for the motor to be positioned after outputing a				
position ins	truction in internal position mod	e. It takes effect in all Step-Changing modes.				
Waiting mo	de=0, adjust time =0ms	Waiting mode =0, adjust time >0ms				
P5-00 Pulse offset /COIN Signal status ON		P5-00 Pulse offset /COIN Signal status ON OFF				
	output 1-segment position	After the drive output 1-segment position				
command, it will	wait for the completion of	command, it will wait for the completion of				
motor positioning,	and then start the next position	motor positioning, and pass the adjust time, then				
command at once.	T1 is positioning time, which	start the next position command. T1 is				
means the time from	m pulse output complete to the	positioning time, t2 is adjust time. Refer to				
output of positionir	ng completion signal.	parameter P4-16.				
Wait mode	= 1, adjust time = 0ms	Wait mode = 1, adjust time $> 0ms$				

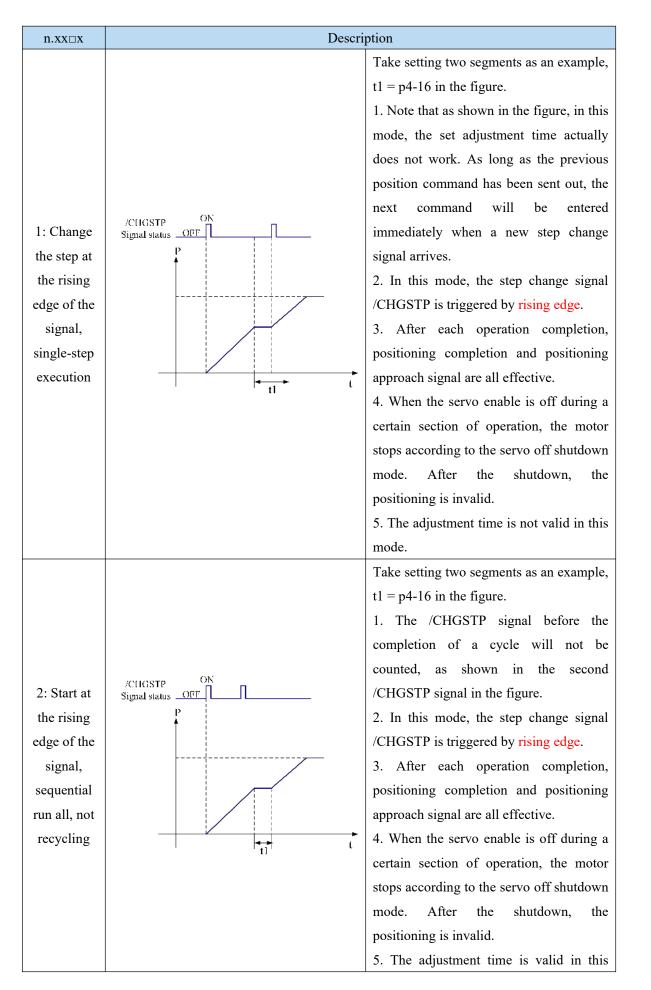

After the drive output 1-segment position command, it will not wait for the completion of motor positioning, and start the next position command at once.

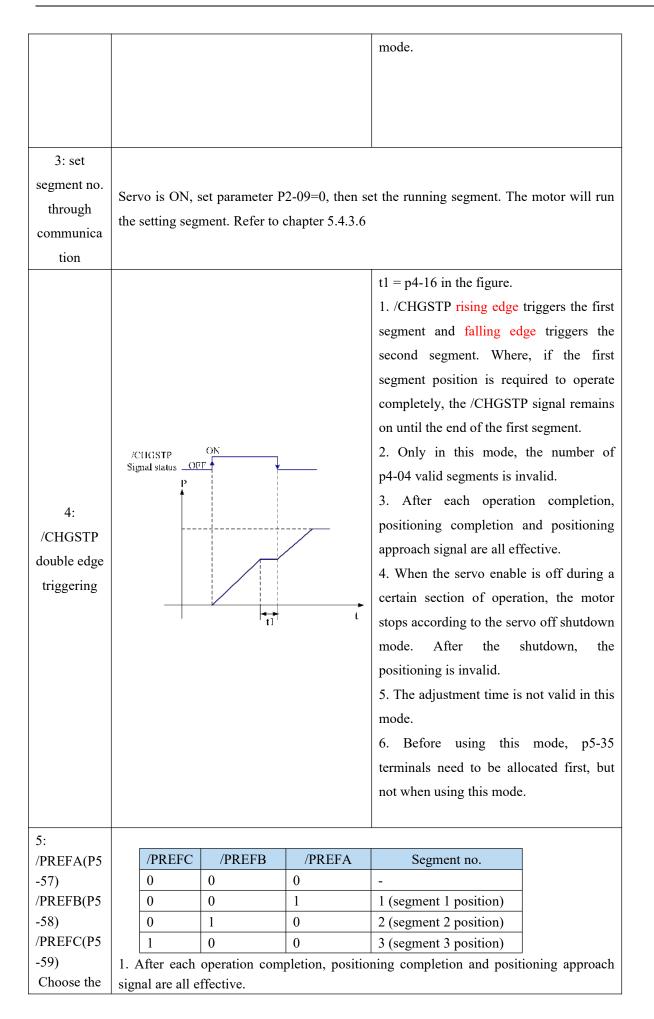

After the drive output 1-segment position command, it will not wait for the completion of motor positioning, but pass the adjust time, and then start the next position command. T2 is adjust time. Refer to parameter P4-16.

2. change step mode

n.xx□x	Descr	iption
0: Change the step when signal is ON, recycling	/CHGSTP OF ON Signal status OFF Segment 1 Segment 2 Segment 1 t t t t t t t t t t t t t t t t t t	 t1=P4-16, t2=P4-23. 1. If the /CHGSTP signal is always on, the servo unit will cycle the set position segment all the time. 2. If the /CHGSTP signal is set to off when executing a certain segment, the servo will continue to complete the execution of that segment without the execution of the next segment. 3. In this mode, the step change signal /CHGSTP is triggered at high level. 4. When the servo enable is off during a certain section of operation, the motor stops according to the servo off shutdown mode. After the shutdown, the positioning is invalid. 5. After each operation completion, positioning completion and positioning approach signal are all effective. 6. In this mode, the adjustment time of each period is valid.

3. Positioning mode

5.4.3.3 Position segment 1 to 35 parameter settings

Parameter	Meaning	Default setting	Unit	Range	Change	Effective
P4-10+ (n-1) *7	Pulse number (low bit)	0	1 pulse	-9999~9999	Anytime	At once
P4-11+ (n-1) *7	Pulse number (high bit)	0	10000 pulses	-32767~32767	Anytime	At once
P4-12+ (n-1) *7	Speed	0	0.1rpm	0~65535	Anytime	At once
P4-13+ (n-1) *7	Trapezoid acceleration time	0	ms	0~65535	Anytime	At once
P4-14+ (n-1) *7	Trapezoid deceleration time	0	ms	0~65535	Anytime	At once

P4-15+ (n-1) *7	Reserved			-		
P4-16+ (n-1) *7	Adjust time	0	ms	0~65535	Anytime	At once

Notes:

1. Set pulse number = pulse number (high bit) $\times 10000$ + pulse number (low bit).

2. In formula P4-10+(n-1)*7, n is the segment no. of internal position; the range is $1\sim35$. Segment $1\sim12$ can be set through the operate panel, segment $13\sim35$ needs to write in parameters through communication (RS232 or RS485).

3. In the relative positioning mode, if the pulse high position is set to 9999, the pulse low position is set to 9999, or the pulse high position is set to - 9999, and the pulse low position is set to - 9999, and p4-03.3 = 1 (do not wait for the positioning to be completed), the infinite pulse mode will be entered. On the contrary, the number of pulses is limited.

4. If one of the segment speed is zero, servo will skip this segment and run the next segment.

5. In relative positioning mode, if one segment speed is not zero but the pulse number is zero, the motor will not run, but the wait mode is effective. The servo will run the next segment when the adjust time is out.

6. In absolute positioning mode, if one segment speed is not zero but the pulse number is zero, the motor will return to the reference origin with the speed of this segment.

7. In absolute positioning mode, if two consecutive segments speed are not zero, but the pulse number is the same, the servo motor will not run but the wait mode is effective.

8. In the absolute positioning mode, the number of rotations of the motor is limited and cannot be unlimited.

9. At present, there are only two kinds of velocity in the internal position mode: step speed and slope speed. When the trapezoidal acceleration time and trapezoidal deceleration time are set to 0, it is in the form of step speed. When the trapezoidal acceleration time and trapezoidal deceleration time are greater than 0, it is in the form of slope speed.

10. Trapezoidal acceleration time and trapezoidal deceleration time refer to the time required to change from 0 to rated speed.

11. If the speed of a certain parameter set is 0, the position command of this section will be ignored in the step change mode of 0/1/2. However, in the mode of 4/5/6, the motor does not rotate when the step change is triggered at this section.

12. In the internal position section parameters, the position commands of pulse settings are still affected by the electronic gear ratio. The actual number of turns of the motor should be determined by combining the set pulse command and the electronic gear ratio.

13. In the absolute positioning mode, the starting position of each step change is based on the starting position of the first triggering step change. In the relative positioning mode, the starting position of each step change is based on the position at the end of the last step change.

14. In the relative positioning mode, the infinite pulse position segment can be set in the 35 segment positions. The motor will run continuously in this segment, unless the trigger skips the current segment.

Parameter	Meaning	Default setting	Range	Change	Effective
P4-04	Effective segment	0	0~35	Servo bb	At once

There are 35 sections in total in the internal position. If 10 sections need to be operated and 5 sections need to be operated switched for use due to process requirements, the effective segment can be set. For example, parameters are set for sections 1-10, and P4-04 is set to 5, that is, the position of section 1-5 is valid; if it is set to 10, the position of section 1-10 is valid.

Parameter	Meaning	Default setting	Unit	Range	Modify	Effective
P4-08	Internal position mode start segment number	1	-	0~35	Servo bb	At once

P4-08 sets the starting operation section number after the first round, and it is valid when the change mode P4-03.1 is set to 0 and 1. The settings are explained below, and valid values are set for No.1-No.8 sections.

Change step mode	Setting	Parameter	Actions					
P4-03.1=0	P4-08=0 or P4-08>P4-04	P4-08=8 P4-04=4	start Segment Segment Segment Segment Segment 4					
	1≤P4-08≤P4-04	P4-08=2 P4-04=4	start Segment Segment Segment Segment Segment					
P4 02 1-1	P4-08=0 or P4-08>P4-04	P4-08=8 P4-04=4	start Segment Segment Segment Segment end					
P4-03.1=1	1≤P4-08≤P4-04	P4-08=2 P4-04=4	start Segment Segment Segment Segment Segment					

When using skip current segment function, the SI terminal assigned by P5-31 needs rising edge trigger.

5.4.3.4 Change step signal (/CHGSTP)

Parameter	Name	Setting	Meaning	Range
P5-35	Change step signal /CHGSTP	n.0000		Range: 0000-0017. Distribute to input terminal through P5-35. When it set to 0001, it means input from SI1.

5.4.3.5 Skip present segment signal (/ZCLAMP)

Parameter	Signal name	Setting	Meaning			Range
P5-31	Skip the present segment /Z-CLAMP	n.0000	Defaulted distribute terminal.	is to	not input	Range: 0000-0017. Distribute to input terminal through P5-31. When it set to 0001, it means input from SI1.

In different Step-Changing modes, the function of skipping the current segment will have different effects, as follows:

Change step mode P4-03 n.xx□x	Skip the present segment	Actions			
0		Cancel current segment, execute the next segment at once			
1	-	Cancel current segment, execute the next segment when the change step signal is ON			
2		Cancel current segment, execute the next segment at once			
3		Cancel current segment, set the F2-09 again			
4	/Z-CLAMP	The current segment is cancelled and the next segment is executed on the falling edge of the /CHGSTP step change signal			
5		If the current segment is cancelled, the corresponding segment will be executed after selecting other segments			
6		The current segment is cancelled, the selected position segment is executed at the rising edge of /CHGSTP step signal			

5.4.3.6 Set segment through communication

Parameter	Meaning	Default setting	Unit	Range	Modify	Effective			
F2-09	Set the segment number through communication	0	-	0~35	Anytime	At once			
change signal Suggestion: A value. To ens	If this parameter is set to a certain segment number, this segment position will be executed without step change signal. Parameters need to be modified through communication. Suggestion: After modifying the F2-09 assignment, it will automatically reset to zero. Simply assign the value. To ensure the normal operation of the data and prevent conflicts between the cache and the current segment, use a rising edge for communication instruction to prevent multiple triggering.								

5.4.3.7 Motion start signal (/MRUN)

Parameter	Signal name	Default setting	Meaning	Modify
P5-50	Motion start /MRUN	n.0000	Terminal output is not assigned by default. It is only valid in the internal position mode, similar to the positioning completion signal in the external pulse mode; there is output when the motor is running, and there is no output when the motor stops.	Parameter range 0000-0014, assigned to the output interface through parameter P5-50. When it is set to 0001, the signal is output from SO1 terminal.

5.5 Speed control

5.5.1 Speed mode general control

5.5.1.1 Soft start

Parameter	Meaning	Defaulted setting	Unit	Range	Modify	Effective			
P3-09	Soft Start Acceleration Time	200	ms	0~65535	Servo bb	At once			
P3-10	Soft Start deceleration Time	200	ms	0~65535	Servo bb	At once			
Soft start ac	celeration and deceler	ation time is s	uitable for mo	de 3/4/7. Smoot	h speed contr	ol can be			
carried out	when step speed instru	ction is input	or internal sett	ing speed is sele	ected.				
P3-09: Tim	e from stop to rated sp	eed							
P3-10: Tim	e from rated speed to s	stop							
	P3-10: Time from rated speed to stop Rated speed Target speed Speed up time P3-09 P3-10								

5.5.1.2 Zero clamp (/ZCLAMP)

1. Overview

This function is used when host controller uses speed command input and the servo system isn't configured the position loop. In other words, the function will be used when the motor must stop and enter lock state even the V-REF input voltage is not zero.

When set ON the zero clamp function, it will configure the position loop inside the servo, the motor will do zero clamp within ± 1 pulse at this position. The motor will return to zero clamp position even it is run by external force.

The present speed must be smaller than zero clamp speed when using zero clamp function, it can clamp the motor shaft from moving. The motor will switch from speed mode to position mode when starting the zero clamp function. At this time, rotate the motor shaft, it will return to the original position. It will not return to original position in speed mode, because it has no position feedback.

2. Input signal setting

Parame ter	Signal	Setting	Meaning	Range
P5-31	Zero clamp	n.0000 (default)	terminal distributed	/Z-CLAMP signal is distributed to input
	/ZCLAMP n.0002	Input signal from SI2 terminal	terminal by parameter P5-31, Range: 0000-0017.	

3. Parameter setting

parameter	Meaning	Default setting	Unit	Range	Change	Effective
P3-13	Zero clamp speed	10	mm/s	0~300	Servo bb	At once
P3-12	Zero clamp mode	0	-	0~3	Servo bb	At once

P3-12 setting	Contents
0	ZCLAMP input signal is ON, forced speed command is 0, when the speed below
0	P3-13, switch to position mode and the servo lock in this position.
1	ZCLAMP input signal is ON, forced set the speed command to 0.
	ZCLAMP input signal is ON, the speed below P3-13, switch to position mode and
2	the servo lock in the position.
2	Note: after entering zero clamp mode, present setting speed is higher than P3-13,
	motor doesn't run, the ZCLAMP signal must be OFF, then motor will run again.
	ZCLAMP signal is ON, the setting speed is less than P3-13, switch to position
3	control mode, and servo is locked at this position. At this time, if setting speed is
	over P3-13, the motor will run again.

5.5.1.3 Speed reach signal (/V-RDY)

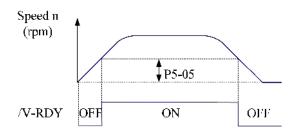

Related parameter

Parameter	Signal	Default setting	Suitable mode	Meaning	Modify	Effective
P5-51	/V-RDY	n.0000	3, 4, 7	Speed reach signal	Anytime	At once

Parameter	Meaning	Default setting	Unit	Range	Modify	Effective
P5-05	Reach speed	1000	mm/s	0~10000	Anytime	At once

Speed arrival signal output condition

When the actual motor speed is greater than P5-05, output speed reach signal (/V-RDY).

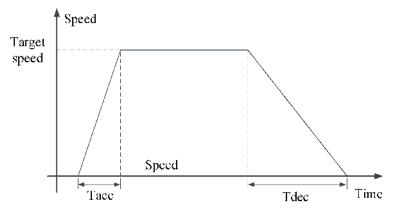

5.5.1.4 Speed command filter

Related	parameter
---------	-----------

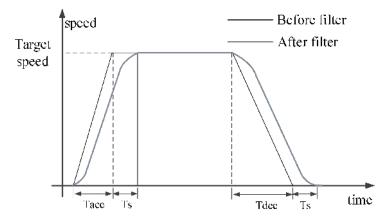

Parameter	Meaning	Default setting	Unit	Range	Modify	Effective
P1-23	Speed command filter time	0	0.1ms	0~65535	Servo bb	At once
P3-09	Acceleration time	200	1ms	0~65535	Servo bb	At once
P3-10	Deceleration time	200	1ms	0~65535	Servo bb	At once
P3-11	Moving average		0.1ms	0~65535	Servo bb	At once

Firstly, set P3-09 and P3-10. Plan the speed command acceleration and deceleration time.

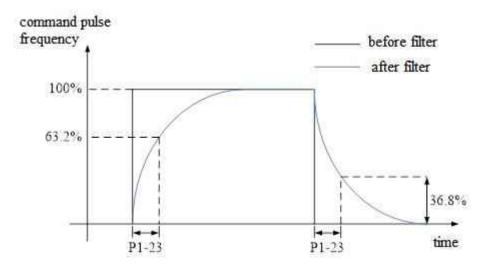

Among them, the acceleration time Tacc=(target speed/rated speed) * P3-09 [ms], and the deceleration time Tdec=(target speed/rated speed) * P3-10 [ms].

Set an appropriate sliding average filtering time constant P3-11 (S-type acceleration and deceleration time constant). Ts=P3-11*0.1 [ms].

Note: The setting of the sliding average filtering time constant must meet the requirements, Ts<0.5 * Tacc, Ts<0.5*Tdec. Otherwise, excessive sliding average filtering time will result in an increase in deceleration time, which does not comply with the settings of P3-09 and P3-10.

When P3-09 and P3-10 are set to 0, setting the sliding average filtering time will change the speed command into a trapezoidal acceleration/deceleration speed command. Set P1-23 (speed command filtering time constant) and P1-24 (first-order low-pass filtering time constant), and the effect is as follows:

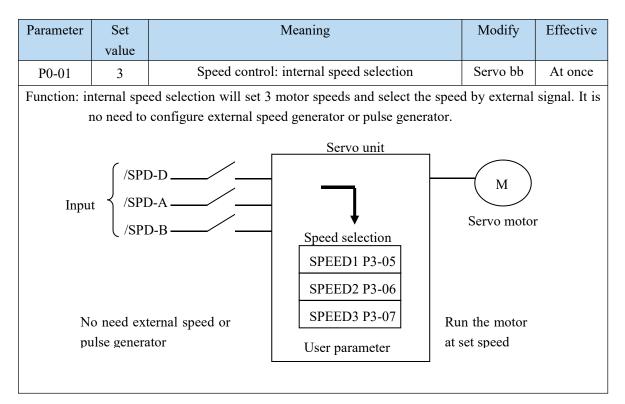

Note: If acceleration and deceleration are set, the first-order low-pass filtering will increase the lag of the speed command.

5.5.2 Speed control (internal speed)

Parameter	Overview	Chapter
P0-01 Control mode selection	Set to 3: internal speed control mode	5.5.2.1
P3-05 Internal speed 1 P3-06 Internal speed 2 P3-07 Internal speed 3	Speed value setting of internal 3-segment speed in rpm	5.5.2.1
P5-28 internal speed selection /SPD-A P5-29 internal speed selection /SPD-B	The combination of terminals determines the speed of corresponding section	5.5.2.1
P5-27 internal speed direction selection /SPD-D	Direction changing, default is n.0000 If the direction changing is given through SI2 terminal, P5-27 can be set to n.0002	5.5.2.1
P3-09 soft start acceleration time P3-10 soft start deceleration time	Set acceleration and deceleration time in ms	5.5.1.1

5.5.2.1 Internal speed mode

Related parameter

Parameter	Meaning	Defaulted setting	Unit	Range	Modify	Effective
P3-05	Internal speed 1	0	mm/s	-9999~+9999	Anytime	At once
P3-06	Internal speed 2	0	mm/s	-9999~+9999	Anytime	At once

P3-07	Internal speed 3	0	mm/s	-9999~+9999	Anytime	At once	

Parameter	Signal	Default setting	Range	Modify	Effective
P5-27	Internal direction /SPD-D	n.0000	Range: 0000-0017. Distribute to input terminal through P5-27.		
P5-28	Internal speed /SPD-A	n.0000	Range: 0000-0017. Distribute to input terminal through P5-28.	Anytime	At once
P5-29	Internal speed /SPD-B	n.0000	Range: 0000-0017. Distribute to input terminal through P5-29.		

1. Correlation between running speed and terminal signal

	Input signal	Dunning speed	
SPD-D (P5-27)	SPD-A (P5-28)	SPD-B (P5-29)	Running speed
	0	0	Internal speed is zero
0: forward run	0	1	P3-05: SPEED1
0. Iorward fun	1	1	P3-06: SPEED2
	1	0	P3-07: SPEED3
	0	0	Internal speed is zero
1	0	1	P3-05: SPEED1
1: reverse run	1	1	P3-06: SPEED2
	1	0	P3-07: SPEED3

Note:

(1) /SPD-D signal is direction control, input SI terminal can be changed according to P5-27. The validity of the terminal signal determines the direction of the motor.

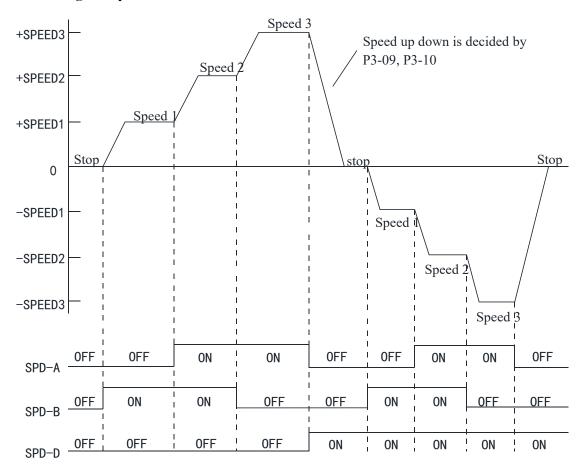

(2) The combination of /SPD-A and /SPD-B input terminal effectiveness determines the multi segment speed(3) 0/1 of the above table represent the validity of the signal. The 0-bit terminal input is invalid. 1 is the terminal input valid.

2. Terminal effectiveness description

The following table takes /SPD-D as an example, /SPD-A, /SPD-B signals are the same.

Parameter setting	Signal/SPD-D terminal input status	Signal/SPD-D terminal logic	
P5-27=n.0000	No need external terminal input		
P5-27=n.000□	SI□ terminal no signal input	Invalid	
P5-27=n.001□	SI□ terminal has signal input		
P5-27=n.0010	No need external terminal input		
P5-27=n.000□	SI terminal has signal input	Valid	
P5-27=n.001□	SI□ terminal no signal input		

3. Running example

5.5.3 Speed control (pulse frequency command)

Parameter	Overview	Reference chapter
P0-01 Control mode selection	Set to 7: external pulse speed mode	5.5.3.1
P0-10 Pulse command form	Set pulse form 0-CW/CCW 2-P+D	5.5.2.2
P0-15 Command pulse frequency at rated speed	Determine the linear relationship between the command pulse frequency and the speed	5.5.3.3
P0-16 Speed command pulse filter time	When the command pulse frequency is relatively low, setting this parameter properly can reduce the speed fluctuation	5.5.3.4
P5-71 Function selection of direction terminal in pulse speed mode	change the pulse direction	5.5.3.5

5.5.3.1 External pulse speed mode

Parameter	Setting value	Meaning	Modify	Effective			
P0-01	7	Speed control: pulse frequency speed command	Servo bb	At once			
Function: sp	peed comm	nand is decided by external pulse frequency, but not rela	ted to pulse c	luantity.			
The wiring is the same as position command. Select CW, CCW mode or direction + pulse mode, AB							
phase pulse mode.							

5.5.3.2 Pulse frequency command

Pulse frequency command is the same as external pulse command position control, refer to chapter 5-4-2.

5.5.3.3 Command pulse frequency at rated speed

Parameter	Meaning	Default setting	Unit	Range	Modify	Effective
P0-15	command pulse frequency at rated speed	1000	100Hz	0~10000	Servo bb	At once
Note: the ur	nit is 100Hz.					
Example: P0-15=300, command pulse frequency at rated speed=30kHz;						
P0-15=1000), command pulse frequen	ncy at rated sp	eed=100kI	Ηz.		

5.5.3.4 Speed command pulse filter time

Parame ter	Meaning	Default setting	Unit	Range	Modify	Effective	
P0-16	speed command pulse filter time	100	0.01ms	0~10000	Servo bb	At once	
When the command pulse frequency is low, setting a suitable value for this parameter can decrease							
the speed	the speed fluctuation.						

5.5.3.5 Speed command pulse direction

Parameter	Meaning	Default setting	Unit	Range	Modify	Effective
P5-71	Function selection of direction terminal in pulse speed mode	0	-	0~1	Servo bb	At once

5.6 Torque control

Parameter	Overview	Reference chapter
P0-01 Control mode selection	Set to 1: internal torque mode	5.6.1
P3-33 Internal torque command	The given value is the percentage	5.6.1.1
	of rated torque	
 P3-16 Internal forward speed limit of torque control P3-17 Internal reverse speed limit of torque control P3-14 Forward max speed limit (MAX speed) P3-15 Reverse max speed limit (MAX speed) 	Speed limit in torque mode	5.6.1.2
P5-27 Speed direction switch /SPD-D	Change the direction, default is n.0000 If it is given through SI2 terminal, P5-27 can be set to n.0002	

5.6.1 Torque control (internal setting)

Parameter	Set value	Function	Modify	Effective			
P0-01	1	Torque control: internal setting	Servo bb	At once			
Function: Control the torque by internal torque command.							

5.6.1.1 Internal torque command

Parame ter	Meaning	Default setting	Unit	Range	Modify	Effe ctive
P3-33	Preset torque 1	0	1% rated torque	-1000~+1000	Anytime	At once
forward a For exam P3-33= -2 In additio	of this parameter is 1 and reverse rotation of aple: P3-33=50, motor 20, motor reverse run on to using the torque and direction.	the motor. forward run v with 20% of th	with 50% of the rated ne rated torque.	torque;	-	

5.6.1.2 Internal speed limit of torque control

Parameter	Meaning	Default setting	Unit	Range	Modify	Effective	
P3-16	internal forward speed limit in torque control mode	Motor rated	mm/s	5~65535	Anytime	At once	
P3-17	internal reverse speed limit in torque control mode	Motor rated	mm/s	5~65535	Anytime	At once	
Note: Even if the setting speed of this parameter is greater than the speed limit of P3-14, the actual effective speed limit is the lower speed limit. (The maximum speed is the smaller value in P3-14/P3-15 and P3-16/P3-17)							

5.6.1.3 Speed reach signal output (/VLT)

In torque mode, when the absolute value of the actual speed of the servo motor exceeds the speed limit value, it is considered that the actual speed of the servo motor is limited. At this time, the servo driver can output /VLT signal. Otherwise, if any condition is not met, the speed limit signal is invalid.

Parameter	Signal name	Default setting	Suitable mode	Meaning	Modify	Effective	
P5-43	/VLT	n.0000	1, 2	Speed limit detection	Anytime	At once	

By default, no terminal is allocated, the parameter range is 0000-0014, and is allocated to the output interface through parameter P5-43. When set to 0002, the signal is output from the SO2 terminal. /VLT signal is only valid in torque mode.

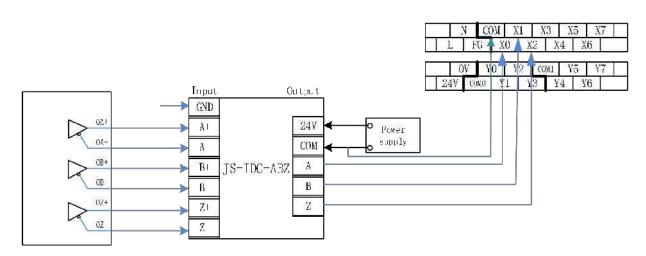

5.7 Encoder ABZ phase frequency division output

The servo drive outputs differential signals through a frequency division output circuit and a differential driver. Provide position signals for the control of the upper computer device, or provide pulse signals for the slave servo, thereby achieving servo control of the master and slave axes.

• Encoder frequency division output specifications

Tamainal name	Terminal function				
Terminal name	CN0 port				
OA+	7	A phase frequency division signal

		setting							

	-	1	0~65535	All	Servo OFF	At once	
	Encoder feedback pulse output frequency division (denominator)						
P0-21	Setting unit	Default	Setting range	Suitable mode	Modify	Effective	
		setting					
	-	1	0~65535	All	Servo OFF	At once	

Explanation:

(1) Number of feedback pulses per polar distance: P0-19*10000 + P0-18. $P0-18 \sim P0-21$ are all parameters related to encoder feedback. P0-18 and P0-19 are grouped together, P0-20 and P0-21 are grouped together, but the number of feedback pulses per polar distance is P0-18, the priority of P0-19 is higher than the feedback pulse output frequency division P0-20, P0-21. Only P0-18, P0-19 all set to 0, P0-20, P0-21 will take effect.

For example, if the motor needs to provide feedback of 2500 pulses per polar distance, P0-18 can be set to 2500, P0-19=0, or set P0-18=P0-19=0, P0-20/P0-21=required motor feedback per polar distance/encoder resolution=2500/131072=625/32768.

(2) The encoder feedback will be output from the CN0 port. If single-phase counting is used, the motor running with a polar distance count value is equal to the set value. If AB phase counting is used, the motor running with a polar distance count value is four times the set value. It is recommended that the lower computer accept pulses using AB phase counting.

(3) The pulse output frequency does not exceed 1MHz per phase, and the number of feedback pulses per polar distance can be set in conjunction with the Z-phase pulse estimation formula.

Example: Assuming the actual speed of the motor is 3000mm/s,

 $\frac{28.08}{3000\times ppr} \quad \times 2 \geqslant \frac{1}{10^6} \Rightarrow ppr \leqslant 18720$

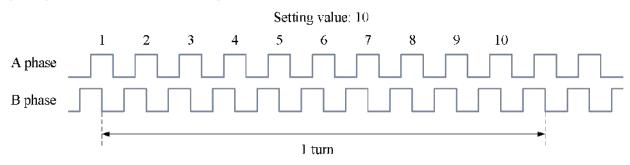

8720 , the feedback setting for the number of pulses per polar distance shall not

exceed 18720 (above 50KHz).

$$\frac{1}{\binom{n}{60} \times ppr} \ge \frac{1}{10^6} \rightarrow ppr \le 20000$$
, the feedback setting for the number of pulses per pole distance shall not

exceed 20000 (below 50KHz).

(4) Assuming that the number of feedback pulses per polar distance is 10, the encoder frequency division pulse output A-phase (PAO) signal and the B-phase (PBO) signal are as follows:

	Encoder fe	edback output direction se	lection				
-	Setting	Function	Default	Suitable mode	Modify	Effective

Z phase	Fuise out	Sut frequency below 30KH	z (unit: s)	Pulse output frequency above 50KHz (unit: s)			
2 pllase pulse		1					
width		$\frac{1}{n} \div 2$		28.08			
		$\frac{1}{\frac{n}{60} \times ppr} \div 2$			$n \times ppr$		

n: Speed, unit: mm/s; ppr: P0-19*10000 + P0-18, Unit Pulse

The above formula is only an estimate.

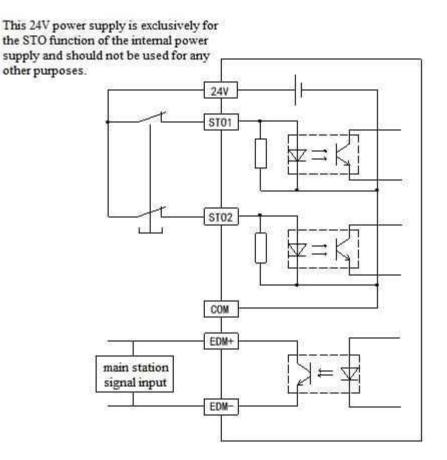

The frequency division output needs to consider the hardware frequency limitations of the receiving end. If the frequency is too high or improperly connected cables are used, it may cause pulse loss.

5.8 STO safe torque off

5.8.1 STO function overview

STO (Safe Torque Off) function: refers to the safety function of cutting off motor current through hardware. The STO safety function terminal (CN5) adopts a dual circuit design, with two safety signal input channels STO1 and STO2. If either terminal is triggered, it will enter the STO state. Through an independent circuit, it prevents the power module that controls the motor current from outputting PWM control signals, thereby cutting off the motor current and achieving a torque free state.

5.8.2 STO wiring diagram

5.8.3 STO parameters

Parameter	Name	Unit	Range	Effective	Function	Default
P0-88	STO synchronous detection configuration	100us	0-1000	At once	STO asynchronous alarm detection time	60
P0-89.0~1	STO buffer circuit Abnormal alarm	100us	0-255	At once	STO buffer circuit Abnormal alarm detection	32

	detection filtering				filtering time	
P0-89.2~3	STO input detection	100us	10-30	At once	STO input detection	12
	filtering				filtering	12
	EDM circuit	100us	0-255	At once	EDM circuit abnormality	200
P0-90.0~1	abnormality alarm	Toous	0-233		alarm detection filtering	200

5.8.4 STO working principle

■ STO triggering

The driver can only operate normally when both the input signals of STO1 and STO2 terminals are at high level. In addition, when an STO alarm occurs, the current STO status can be determined based on the EDM output signal status, as shown in the table below:

STO1 input	STO2 input	EDM output status	PWM control signal
Н	Н	No output	Normal
Н	L	No output	Prohibited
L	Н	No output	Prohibited
L	L	With output	Prohibited

When either STO1 or STO2 is at a low level, the servo enters the STO state. At this time:

- (1) PWM control signal prohibition;
- (2) The servo stops as the turn off enable mode in P0-29 alarm stop mode;
- (3) The servo/S-RDY signal output is 0;
- (4) The panel displays STO.

When both STO1 and STO2 are at low levels, the EDM output circuit becomes conductive;

When the status of STO1 and STO2 is inconsistent and the time exceeds the set time of P0-88, alarm E-340: STO status is not synchronized.

Ensure that the STO1 and STO2 pins do not respond to pulses below 1ms, and ensure that it responds to the pulse higher than the setting in P0-89.2-3.

An alarm occurs in the STO state, and the panel displays the alarm information. However, the servo is still in the STO state at this time, and the dynamic braking and holding brake configurations are configured according to the STO state.

■ STO release

When both STO1 and STO2 terminals are at high level and the enable signal is in a non enable state, the STO state is released, the servo ready output signal/S-RDY is output according to P5-70 configuration, the dynamic braking is output according to P0-27 or P0-29 configuration.

5.8.5 STO function precautions

After the STO function is activated, the motor safely enters a torque free state, and the servo drive will no longer have control over the motor. Therefore, before using the STO function, please evaluate the hazards that still exist after the STO function is enabled:

- After the STO function is enabled, the servo cannot guarantee that the motor will move due to external forces, such as the vertical axis;
- The STO function cannot cut off the power supply of the servo unit. The strong electrical part of the driver is still charged, so there is still a risk of electric shock or other electrical hazards. When maintaining the servo unit, please be sure to cut off the power supply and other devices of the servo unit;
- Please use the single power supply provided by the safety function terminal CN5 to supply power to the STO signal input, otherwise the STO function may malfunction due to leakage current, making it impossible to enter the STO cut-off state.

If the STO function is used to stop a running servo, the motor will gradually stop. If it is not acceptable, the system should use the correct stop mode instead of using the STO function to stop.

All cables suitable for STO function must have good protection, wiring, and fixation. During installation, it is necessary to ensure that the cables are not pulled or squeezed. The requirements for the cables used are as follows:

Cable	Explanation
requirements	
Туре	Double shielded or single shielded twisted pair multiple pair cables
Max length	The maximum allowable cable length between the driver and safety switch is
	30m
Max size	0.8mm ² (18 AWG)
Min size	0.3mm ² (28 AWG)

6 EtherCAT bus communication

6.1 EtherCAT technical overview

This section mainly introduces the basic concept, system composition, communication specifications and connection instructions of EtherCAT.

6.1.1 EtherCAT introduction

EtherCAT, the full name is Ethernet for Control Automation Technology, which is developed by Beckhoff Atuomation GmbH. It is a kind of real-time Ethernet used for open network communication between master station and slave station. As a mature industrial Ethernet technology, EtherCAT has the characteristics of high performance, low cost and easy to use.

XG2, XDH or XLH series controller (master station) and DL6 linear servo driver (slave station) comply with the standard EtherCAT protocol, supports the maximum 64-axis slave stations, 64-axis synchronization cycle is 4ms, supports touch probe function, position, speed, torque and other control modes, is widely applicable to various industries.

6.1.2 System composition(master and slave station)

The connection form of EtherCAT is: the network system of linear connection master station (FA controller) and multiple slave stations.

The number of nodes that can be connected by the slave station depends on the processing or communication period of the master station, the number of bytes transmitted, etc.

6.2 EtherCAT communication specification

This section mainly introduces EtherCAT's frame structure, state machine, ESC, SDO, PDO, SII area, communication synchronization mode, etc.

Item			Specification				
Physical layer	100BASE-TX(IEEE	802.3)					
Baud rate	100[Mbps](full dupl	ex)					
Topology	Line						
Connection cable	JC-CB/JC-CA twisted pair(shield twisted pair)						
Cable length	Maximum 50m between nodes						
Com port	2 Port(RJ45)						
EtherCAT indicators (LED)	[Run]RUN indicator[L/A IN] Port0 Link/Activity indicator(Green)[L/A OUT] Port1 Link/Activity indicator(Green)						
Station Alias(ID)	Setting range: 0~655 Setting address:2700						
Explicit Device ID	Not support						
Mailbox protocol	COE(CANopen Over EtherCAT)						
SyncManager	4						
FMMU	3						
Modes of operation	Position Speed Torque	Hm Csv Pv Cst	Modes of operationCyclic synchronous position modeProfile position modeHoming modeCyclic synchronous velocity modeProfile velocity modeCyclic synchronous torque modeTorque profile mode				
Touch Probe	2 channels						
Synchronization mode	DC(SYNCO event s		,				
Cyclic time (DC communication period)	250, 500,1000,2000,						
Communication object	SDO[service data ob	ject], PI	OO[process data object]				
Maximum PDO allocation per station	TxPDO:4 [piece]	RxPD	D:4 [piece]				
Single station PDO Max bytes	TxPDO:32[byte]	RxPD	O:32[byte]				
Mailboxcommunicationinterval in PreOP mode	lms						
Mailbox	SDO request and SD	O infor	nation				

6.2.1 Communication specification

Note:SDO and PDO refer to chapter 6.2.3 state machine.

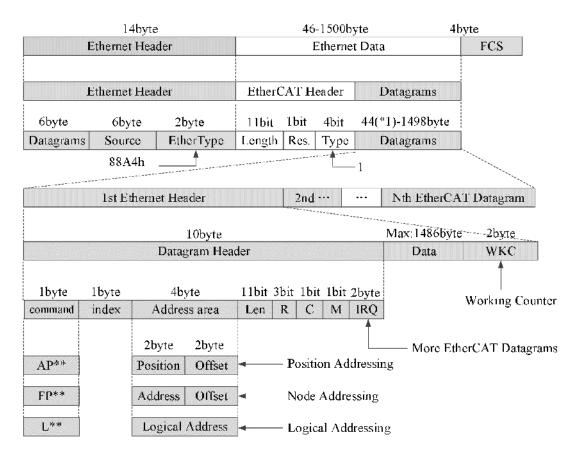

6.2.2 EtherCAT frame structure

EtherCAT is an industrial communication protocol based on real-time control of Ethernet. It only expands the IEEE 802.3 Ethernet specification and does not change the basic structure, so it can transmit the data within the standard Ethernet frame.

Because the EthernetType of the Ethernet Header is [88A4h], the subsequent Ethernet data is processed as the EtherCAT frame.

The EtherCAT frame is composed of the EtherCAT frame header and more than one EtherCAT sub message, which is further subdivided. Only the EtherCAT frame with type = 1 of the EtherCAT frame header is processed according to ESC.

EtherNet/EtherCAT frame structure

*1:When Ethernet frame is shorter than 64byte, add 1~32byte. (Ethernet Header + Ethernet Data + FCS)

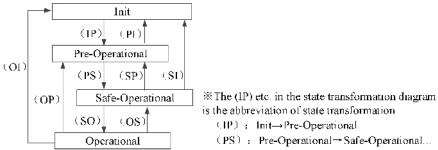

6.2.3 State machine ESM

The EtherCAT state machine (ESM) is responsible for coordinating the state relationship between the master and slave applications at initialization and runtime.

The state change request is executed by the master station, and the master station puts forward the control request to the application layer service. The latter generates the application layer control event in the slave

station, and the slave station responds to the application layer control service through the local application layer state write service after the state change request succeeds or fails. If the state change fails, the slave station keeps the state and shows the error flag.

The figure below	shows the state	transformation	diagram of ESM:
------------------	-----------------	----------------	-----------------

Init:	Initialization status
Pre-Operational:	Pre operation status
Safe-Operational:	Safe operation status
Operational:	Running state

		Communi	cation action	
Slave station status	Actions in various states	SDO(mailbox) receive and send messages	PDO Send messages	PDO Receive message s
Init	Communication initialization, SDO, PDO unable to receive and send messages	-	-	-
Pre-Operational (PreOP)	Only SDO receives and sends messages	Yes	-	-
Safe-Operationa l(SafeOP)	Only SDO receives and sends messages, PDO sends messages	Yes	Yes	-
Operational (OP)	SDO receives and sends messages, PDO receives and sends messages	Yes	Yes	Yes

Note: the access from the master station to the ESC register is independent of the above table and is available at any time.

PDO (Process Data Object) Used to transmit periodic communication data.

SDO (Service Data Object) Used to transmit aperiodic communication data.

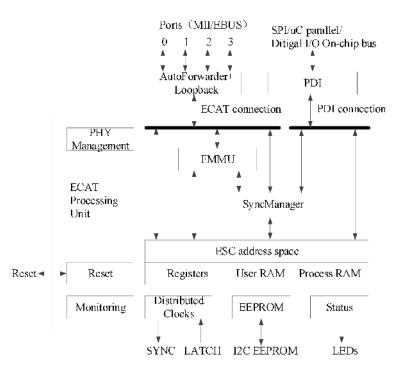

Command or interface operation during ESM state switching may cause abnormal communication error

6.2.4 Slave station controller ESC

6.2.4.1 Principle overview

ESC refers to the EtherCAT slave controller. The communication process is completely processed by ESC, which has four data receiving and transmitting ports, each with a Tx and Rx. Each port can send and receive

Ethernet data frames. The data flow direction in ESC is fixed: port $0 \rightarrow$ -port $3 \rightarrow$ port $1 \rightarrow$ port $2 \rightarrow$ port 0 are transmitted in sequence. If ESC detects that a port has no external PHY, it will automatically close the port and forward to the next port through the internal loopback.

6.2.4.2 Address space

The DL6 series have 8 Kbyte of physical address space.

The first 4kbyte (0000h-0FFFh) is used as register space, and the other 4kbyte (1000h-1FFFh) is used as process data PDO in RAM field. For details of registers, please refer to the data table of IP (ET1810 / ET1811 / ET1812).

6.2.5 SII area (0000h~003Fh)

In the ESC configuration area (EEPROM word address 0000h-0007h), after the power of the driver is started, the Configured Station Alias automatically reads and writes the ESC register according to ESC. When the value of SII EEPROM is reflected in the ESC register, the power supply needs to be started again. In addition, the initial value of IP core (ET1810 / ET1811 / ET1812) is set. Please refer to the data table of IP core (ET1810 / ET1811 / ET1812) for details.

6.2.6 SDO(Service Data Object)

DL6 series supports SDO (Service Data Object). The data exchange of SDO uses mailbox communication, so the data refresh time of SDO becomes unstable.

The master station reads and writes data in the records of the object dictionary, which can set the object and monitor various states of the slave station. The response to a read-write action to SDO takes time. For objects refreshed with PDO, please do not refresh with SDO, and overwrite with PDO value.

6.2.6.1 Mailbox frame structure

Mailbox/SDO frame structure is shown as below. Please refer to ETG specification book (ETG1000-5 and ETG1000-6).

Ethernet l	Header EthernC	AT Hea	ader 1st Ether	CAT	Datagram 2nd…	··· Nth··· FCS

6.2.6.2 Mailbox overtime

This servo driver performs the following timeout settings in mailbox communication.

Timeout of mailbox request: 100ms

The master station sends a request to the slave station (driver). If the WKC of the transmission data of the request frame is updated, the slave station is considered to receive the request normally. Until WKC is updated, retry again and again. However, if WKC is not updated until this set time, the master station will time out.Timeout for mailbox response: 10s

The master receives a response from a request from a slave (driver), which is considered normal if the WKC is updated. Until this set time, if the response of updated WKC cannot be received, the master station will time out. The maximum time required for the response of the slave (driver) to complete.

6.2.6.3 Alarm information

1) Error code

Error code returns the same value as 603Fh (Error code).

0000h \sim FEFFh are defined as IEC61800-7-201.

 $FF00h \sim FFFFh$ are defined by manufacturer, shown as below.

Index	Sub-index	Name/Description	Range	Data type	Access	PDO	Op-mode
603Fh	00h	Error code	0-65535	U16	ro	TxPDO	All

Now the alarm of the servo driver (only the main number).
When the alarm does not occur, it will display 0000H.
When an alarm occurs, an alarm is displayed.
FF**h
Alarm (main) code (00h~FFh)
Eg. FF03h 03h=3d E-030 (over voltage protection)
FF55h55h=85d E-850 (TxPDO configuration error protection), E-851 (RxPDO
configuration error protection), any of them occurred.
As an exception, A000h is displayed in the case of E-817 (Syncmanager 2/3 setting error).

1) Error register

Error register returns same value as 1001h (Error register).

Index	Sub-index	Nam	ne/Descr	ription	Range	Data type	Access	PDO	Op-mode
1001h	00h	Error register		0-65535	U16	ro	TxPDO	All	
		Displa	Displays the type of alarm (status) that is occurring to the servo driver.						
		When	When the alarm does not occur, it will display 0000H.						
		Do no	ot display	y warning	gs.				
								_	
			Bit		С	ontents			
			0

		*1:"AL status code defined alarm" means EtherCAT communication related error E-800 \sim							
		7, E-8	7, E-810~7, E-850~7.						
		*2:"A	*2:"AL status code not defined alarm" means EtherCAT communication related error						
		E-880	\sim 7 and	except E	EtherCAT com	munication re	elated error.		

6.2.7 PDO(Process Data object)

DL6 series supports PDO (process data object).

The real-time data transfer based on EtherCAT is carried out through the data exchange of PDO (process data object).

PDO has RxPDO transferred from master station to slave station and TxPDO transferred from slave station to master station.

	Send	Receive
RxPDO	Main station	Slave station
TxPDO	Slave station	Main station

6.2.7.1 PDO mapping objects

PDO mapping refers to the mapping from object dictionary to application object of PDO.

Tables for DL6 series PDO mapping can use 1600h-1603h mapping objects for RxPDO and 1A00h-1A03h mapping objects for TxPDO.

The maximum number of application objects that a mapping object can map is as follows: RxPDO: 32 [byte], TxPDO: 32 [byte]

The following is an example of setting up a PDO map.

< Setting example >

Allocation of application objects 6040h, 6060h, 607ah, 60b8h to 1600h (receive PDO mapping 1: RxPDO_1).

Index	Sub	Object contents		
1600h	00h	04h		
	01h	6040 00 10 h		
	02h	6060 00 08 h		
	03h	607A 00 20 h		
	04h	60B8 00 10 h		
	05h	0000 00 00 h		
	18h	0000 00 00 h		
6040h	00h	Controlword U16		
6060h	00h	Mode of operation I8		
607Ah	00h	Target Position I32		
60B8h	00h	Touch probe function U16		

6.2.7.2 PDO distribution objects

In order to exchange PDO data, a table for PDO mapping must be assigned to SyncManager. The relationship between the table used for PDO mapping and SyncManager is described to PDO allocation object. DS5C2 series, as PDO allocation object, can use 1C12h for RxPDO (SyncManager2) and 1C13h for TxPDO (SyncManager3). The maximum number of application objects that a mapping object can map is as follows:

RxPDO: 4 [Table] (1600h~1603h)

RxPDO: 4 [Table](1A00h~1A03h)

Generally, since one mapping object is enough, no change is required by default.

Example of setting PDO assignment object:

Allocation mapping object 1600h to allocation object 1C12h (Sync Manager Channel 2).

Index	Sub	Object contents
1C12h	00h	01h
	01h	1600h
	02h	0000h
	03h	0000h
	04h	0000h

Allocation mapping object 1600h to allocation object 1C13h (Sync Manager Channel 3).

Index	Sub	Object contents
1C13h	00h	01h
	01h	1A00h
	02h	0000h

Index Sub		Object contents
	03h	0000h
	04h	0000h

6.2.8 Communication synchronization mode

Synchronization	Contents	Synchronization methods	Features			
modes						
DC	SYNC0 Event	Synchronize the time	High-precision			
	synchronization	information of other slave	Compensation treatment shall be carried out			
		stations based on the time	at the main station			
		of the first axis				
SM2	SM2 Event	Synchronize according to	No transmission delay compensation, poor			
	synchronization	RxPDO's receiving time	accuracy			
			Need to keep transmission time on			
			controller side (special hardware, etc.)			
FreeRun	Asynchronous	Asynchronous	Simple handling			
			Poor real-time performance			

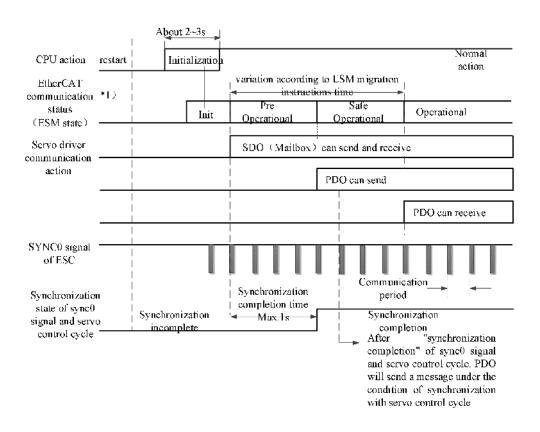

DL6 series can select the following synchronization modes.

6.2.8.1 DC(SYNC0 event synchronization)

DL6 series have 64bit DC (Distributed Clock).

The synchronization of EtherCAT communication is based on this DC. According to the DC slave station, synchronization is realized through the system time with the same reference. The local cycle of the slave station starts with the SYNC0 event. Since the slave processing (servo processing) starts from the SYNC0 event cycle, it is always synchronized with the SYNC0 event.

The master station needs to carry out transmission delay compensation (offset compensation) and regular deviation compensation during communication initialization. The following figure shows the process of synchronous completion from the input of control power to the event of SYNC0 and the processing of slave station (servo processing).

6.2.8.2 SM2(SM2 event synchronization)

The local cycle of the slave station starts with SM2 events.

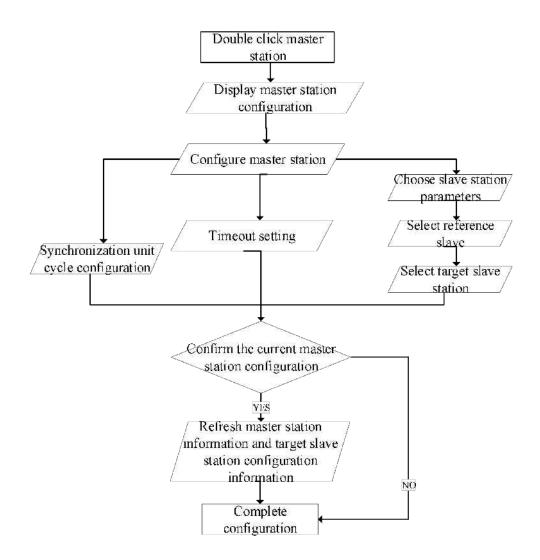

Since the processing of the slave station starts from the SM2 event cycle, it is always synchronized with SM2 events.

Because SM2 event occurs when PDO receiving is completed, it is necessary to ensure that the upper (Master) side sends the message regularly. If the fluctuation (deviation) of sending time is too large, synchronization cannot be completed, or an alarm occurs.

If this happens, please use DC (SYNC0 event synchronization).

7 EtherCAT bus control mode

7.1 EtherCAT operation

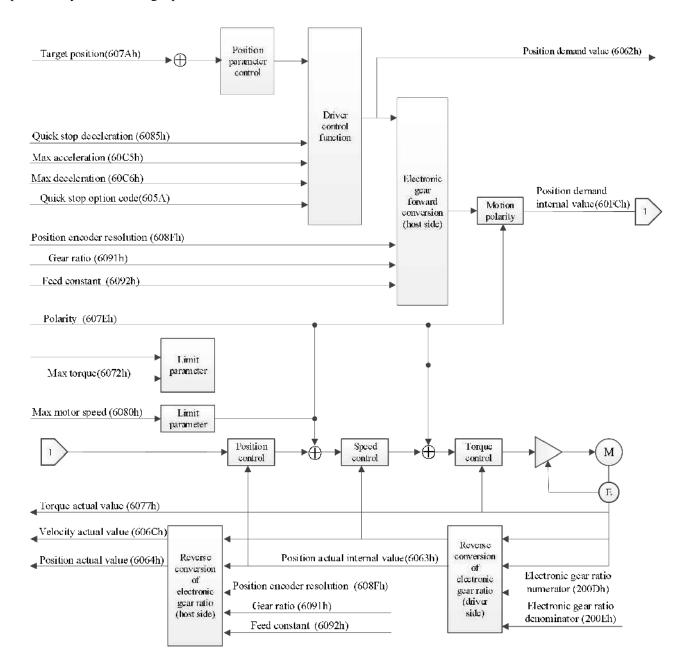

The following table shows the parameters that must be configured uniformly in CSP, CSV, CST, PP, PV and TQ modes.

Register	Explanation
RXPDO[0x6040]	Controlword must be added to the PDO configuration. It is invalid to modify it through IO
	mapping in CSP, CSV and CST modes. It is controlled by the NC module
RXPDO[0x6060]	Modes of operation, must be added to the PDO configuration, and can be modified by IO
	mapping in the task mode.
RXPDO[0x607A]	Target position, the given location of the program, must be added to the PDO configuration
TXPDO[0x6041]	Statusword, must be added to PDO configuration
TXPDO[0x6061]	Modes of operation display, must be added to PDO configuration
TXPDO[0x6064]	Position actual value, must be added to PDO configuration
TXPDO[0x606C]	Velocity actual value, must be added to PDO configuration

7.2 CSP mode

CSP (periodic synchronous position mode), whose motion trajectory is calculated by the upper computer, periodically sends the target position to the slave station.

7.2.1 Related parameters

1)CSP Control mode associated object(Command • setting)

	error		=6062h (Position demand value) – 6064h (Position actual value) is over the					
			setting range of 6065h (Following error window) or 60F4h value is over the					
			setting value of 6065h, not through the setting time of 6066h.					
		1	60F4h (Following error actual value)					
			is over the setting range of 6065h (Following error window) and above the					
			setting time of 6066h (Following error time out)					

bit13,12,10(operation mode specific):

Note: the "performing actions according to the target position" means that if all the following conditions are met:

- ◆ PDS status is operation enabled
- Not in deceleration process(Halt, Quick stop, Shutdown, Disable operation, Fault)
- Non Halt stop status

Actions in CSP control mode

- The cyclic position control mode is to generate the action model (track) through the host rather than the slave.
- The target position is the sum of 607Ah (target position) and 60B0h (position offset), which is understood as absolute position.
- The update (sending) of action command is that after the servo enable command (operation enabled command), please input after about 100 ms.
- ♦ 60C2h (interpolation time period), which means updating the period of 607AH (target position) and 60B0h (position offset). This value is set to the same period as 1C32h-02h (cycle time). The upper device (host) must update the target position through 60C2h (interpolation time period).
- The servo enable can be turned off. Please form 607Ah (target position) + 60B0h (position offset) to follow the host processing of 6064h (position actual value). If the motor moves by external force during the servo enable is turned off, if the servo enable is turned on next time, it is very dangerous because it needs to return to the input target position. In addition, when switching from control mode other than CSP control mode to CSP control mode, please also do the follow operation.

	on when servo enable is turned off (when the ot set at the actual position value)
Servo enable ON PDS state: operation enable	Command position(command) Actual position
Servo enable OFF PDS state: switch on	Command position(command) _{Workpiece} moving under external force Actual position
Servo enable ON PDS state: operation enable	Command position(command) Danger due to rapid return of command position

bit13,12,10(operation mode specific):

Bit	Name	Value	Definition
10	Reserved	-	Unuse
12	Reserved	0	Action not performed according to target speed
	Reserved	1	Perform the action according to the target speed
13	Reserved	-	Unuse

The "performing actions according to target speed" should meet the following conditions:

- The PDS status is operation enabled
- Not in deceleration processing (halt, quickstop, shutdown, disable operation, falut)
- It is not a halt state.
- The torque limit does not occur

Actions in CSV control mode

- In the cyclic speed control mode, the motion model (trajectory) is generated not on the slave but on the master.
- The target speed is 60FFh (target velocity)
- The update (sending) of action command is that after the operation enabled command, please input it after about 100 ms.
- 60C2h (interpolation time period) means the period of updating 60FFh (target velocity) and 60B1h (velocity offset). This value is set to the same period as 1C32h-02h (cycle time).
- As monitoring information, provide 606Ch (velocity actual value), etc.
- The 60FFh (target velocity) value is limited by 6080h (max motor speed).

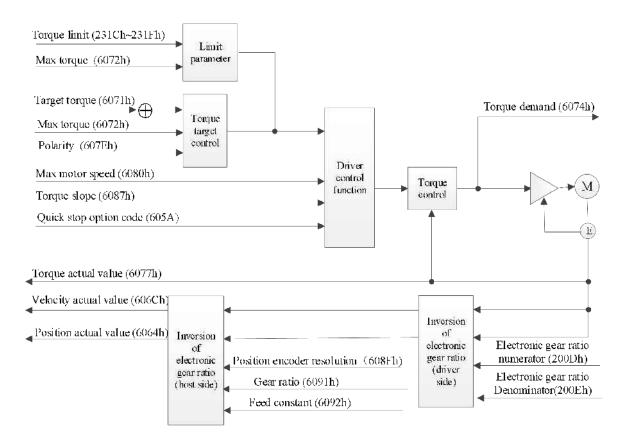

7.3.2 Common parameters

Register	Explanation	Unit
RXPDO[0x60FF]	Target velocity	Command unit/s
TXPDO[0x6064]	Position feedback	Command unit
TXPDO[0x606C]	Velocity feedback	Command unit/s
RXPDO[0x6080]	Max motor speed, which can be modified through COE-Online	r/min

RXPDO[0x6060]	Control mode is CSV (Periodic Synchronous Speed Mode),	-
	set its value to 9	

7.4 CST mode

CST (periodic synchronous torque mode) allows the motor to run at a constant torque through the torque given by the upper computer.

bit13,12,10(operation mode specific):

Bit	Name	Value	Definition
10	Reserved	-	Unuse
12	Torque	0	Action not performed according to target torque
		1	Perform the action according to the target torque
13	Reserved	-	Unuse

Performing actions according to target torque should meet the following conditions:

- The PDS status is operation enabled
- not in deceleration processing (halt, quickstop, shutdown, disable operation, falut)
- It is not a halt state

Actions of CST control mode

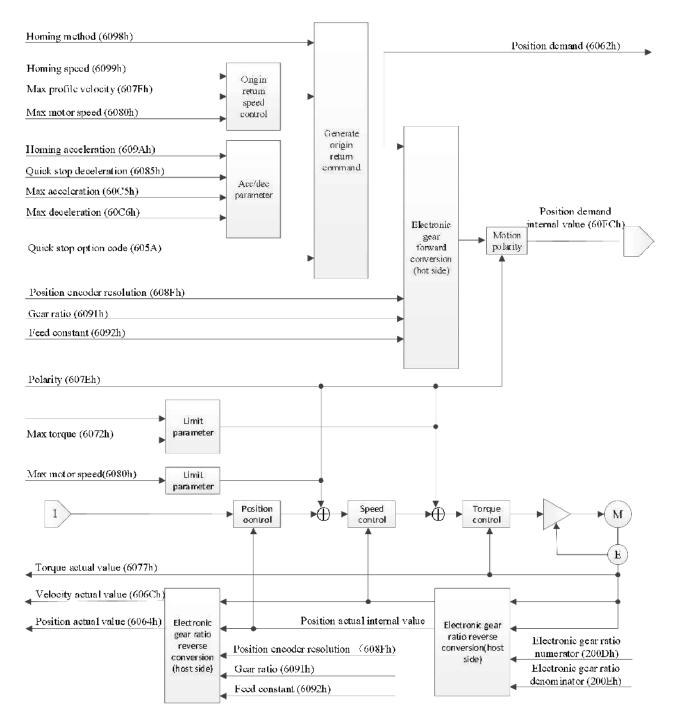

- In the cyclic torque control mode, the mode profile generation is not in the slave but in the host.
- The target torque is 6071h (target torque)
- The torque feedforward is 60B2h (torque offset), which is not supported temporarily.
- The update (sending) of action command, after the servo is on, please input after about 100ms.
- 60C2h (interpolation time period) means updating the period of 6071h (target torque) and 60B2h (torque offset). This value is set to the same period as 1C32h-02h (cycle time).
- As monitoring information, provide 6077h (torque actual value), etc.
- The 6071h (target torque) value is limited by 6072h (max torque), 2312h (P3-28), 2313h (P3-29), the minimum value.
- The speed limit is 6080h (max motor speed).

7.4.2 Common parameters

Register	Explanation	Unit
RXPDO[0x6071]	Target torque	0.1%
TXPDO[0x6064]	Position feedback	Command unit
TXPDO[0x606C]	Velocity feedback	Command unit /s
TXPDO[0x6077]	Torque feedback	0.1%
RXPDO[0x6080]	Max motor speed	r/min
RXPDO[0x6060]	Control mode is CST (Periodic	-
	Synchronous Torque Mode), set its	
	value to 10	

7.5 HM mode

HM mode (i.e. home mode) is used for initialization of the slave station position. An origin reset method is a position control mode that specifies an operation speed and generates a position command inside the servo driver to perform an origin reset operation. If it is used in the incremental mode, after the control power is put into operation, it is necessary to perform the zero point reset action before performing the position positioning work.

The relationship between * value and Homing method please refer to 6098h (Homing method).

2) The action of HM control mode (Homing action)

When using in incremental mode, in order to initialize the location information before starting the normal action, please execute the homing action.

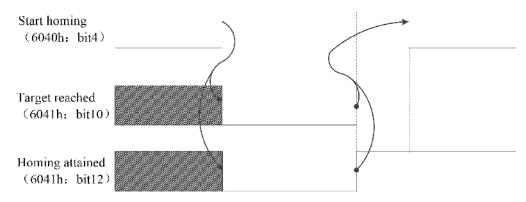

• After the origin position is detected, this position is used as the reference to initialize the following objects (preset).

6062h(Position demand value)= 6064h(Position actual value)= 607Ch(Home offset) 6063h(Position actual internal value)= 60FCh(Position demand internal value)= 0

- If the origin point reset is performed, the position information is initialized (preset). Therefore, it is necessary to obtain the data based on the old location information again (touch probe location, etc.).
- Whether 607Ch (home offset) is changed or not in the homing action, it is not reflected in the executing homing action. The next homing action will be reflected (initialization of position information upon completion).
- 607C (me offset) is only valid in homing mode 35 and 37.
- If the edge of the switch signal (T, NOT, HOME) is used as the detection position of the origin, please assign each clamping compensation pin to SI1, SI2, SI3. If it is not allocated correctly, an error will be reported in the origin reset. (Note: P5-22 of DS5C2 series servo is the setting address of positive limit, the default value is 1, the corresponding servo terminal is SI1; P5-23 is the setting address of negative limit NOT, the default value is 2, the corresponding servo terminal is SI2; P5-27 is the setting address of origin, the default value is 3, the corresponding servo terminal is SI3.)
- In the Method diagrams described later, the meaning of below terms:

Index pulse	Z phase signal of encoder
Home switch	Theoretical signal state of near origin input(ME)
Positive limit	Theoretical signal state of forward drive inhibit input(POT)
Negative limit	Theoretical signal state of negative drive inhibit input(NOT)

- After the update (sending) of action command and the operation enabled command, please input after about 100 ms.
- The following shows the timing of the HM control mode.

Homing error occurrence condition

According to the homing action, the conditions for an exception (homing error = 1) are as follows.

Homing error occurrence condition	Details
Startup except Operation	Start Homing when PDS status is not Operation enabled (except for method35,

enabled	37)			
	Startup Homing when 6099h-01h and 6099h-02h is set to 0			
Startup under target speed 0	except 6099h-02h of method33, 34 and 6099h-01h, 6099h-02h of method35, 37			
	are 0)			
detected out two Limit	Two limit switches of positive/negative are detected during the homing start or			
switch	the homing action.			
	Under the method reversed by limit switch, in the reverse deceleration action			
Use Limit switch	after the rising edge of limit switch is detected, the falling edge of limit switch is			
	detected			
Home switch, Limit switch	Not distribute IO terminal			
not distributed

Control word (6040h)

Set it to (0x06 > 0x0f > 0x1f) in sequence, enable the driver and start the motor to operate, and homing is enabled.

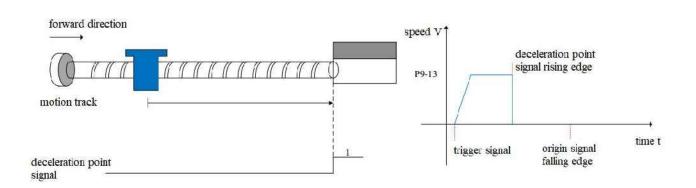

7.5.3 Homing method

Now DL6 servo driver support 1~14, 17~30, 33, 34, 35, 37 and -1, -2 homing method.

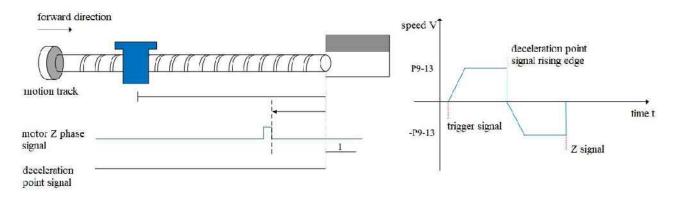

■ Method -1:

The servo motor first runs at a forward low speed with the set value of 6099h:02 (low speed for homing). After hitting the mechanical limit position, if the absolute value of the torque reaches the upper limit of P9-17 (touch stop homing torque threshold), and the absolute value of the speed is lower than the set value of P9-16 (touch stop homing speed threshold), this state is maintained for the set time of P9-18 (touch stop homing time threshold), and it is judged to have reached the mechanical limit position. Then it can be divided into two situations:

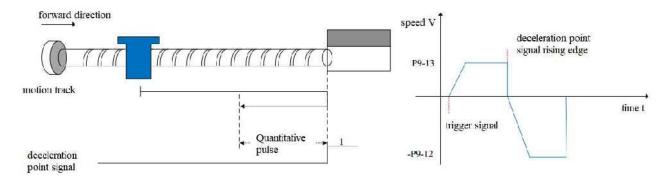

① P7-20=0, and the number of quantitative pulses is 0. At this point, immediately stop the machine and calibrate it as zero (position reset);

(2) P7-20>0, the number of quantitative pulses is 0, and it runs in reverse at the setting homing low speed. When encountering the rising edge of P7-20 Z-phase signals, it immediately stops and calibrates the zero point (position reset).

③ P7-20=0, and the number of quantitative pulses is not 0. First, run in the forward direction at low speed (6099h: 02), and after touching the mechanical point, run in the reverse direction at homing high speed (6099h: 01). After the quantitative pulse length is reached, stop the machine and calibrate it as the zero point (Ecat position is reset to zero);

④ P7-20>0, the number of quantitative pulses is not 0. First, run in the forward direction at low speed (6099h: 02), and then run in the reverse direction at the set homing low speed (6099h: 02) when encountering the mechnical origin, stop machine when encountering the rising edge of P7-20 Z-phase signals. After stopping, run the quantitative pulse length at the homing high speed (6099h: 01), and then stop the machine. Calibrate the zero point (Ecat position is reset).

Paramete	r Function	Unit	Default value	Range	Effective time	Suitable mode
P7-20	Ethercat homing find the Z phase	-	1	-9999~9999	0	EtherCAT

numbers mode			 -	 	
		numbers			mode

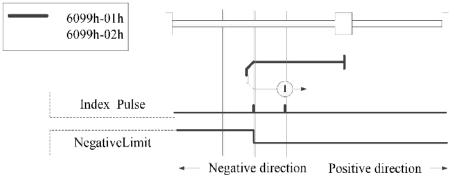

The positive and negative values of the P7-20 parameters represent the direction of homing, with positive values indicating the forward direction of finding the origin, negative values indicating the reverse direction of finding the origin, and absolute values indicating the number of Z-phase points for homing.

■ Method -2:

Similar to the previous homing action, running in the opposite direction.

■ Method 1:

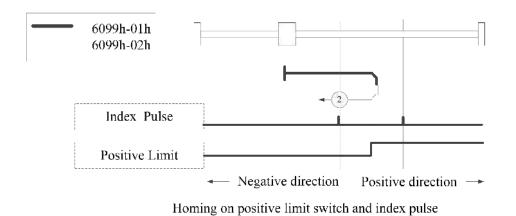

When using this homing method 1, if the reverse limit switch is in a non triggered state, the initial direction of movement is left. The first Z-phase pulse to the right of the position where the negative limit switch becomes invalid at the origin position.

Homing on negative limit switch and index pulse

Method 2:

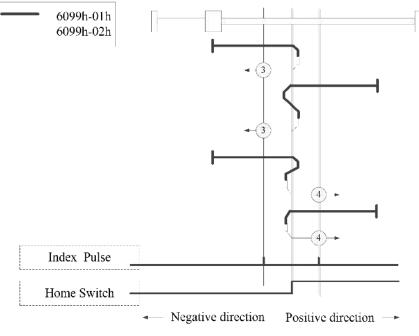

When using method 2, if the forward limit switch is not triggered, the initial movement direction is to the right. The origin position is at the first Z-phase pulse to the left of the position where the forward limit switch becomes invalid.

■ Method 3, 4:

Using method 3 or 4, the initial direction of movement depends on the state of the origin switch. The origin

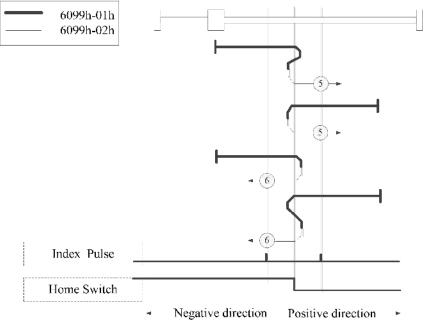

position is on the reverse side of the origin switch or at the initial detected Z-phase position in the forward rotation direction.

Homing on positive home switch and index pulse

■ Method 5, 6:

Using method 5 or 6, the initial direction of movement depends on the state of the origin switch. The origin position is on the reverse side of the origin switch or at the initial detected Z-phase position in the forward rotation direction.

Homing on negative home switch and index pulse

• Method $7 \sim 14$:

7-14 all use origin switches and Z-phase signals;

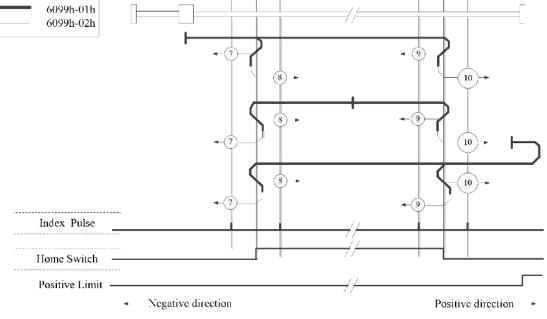

The initial action direction of modes 7 and 8 is negative if the origin switch is already activated at the beginning of the action;

The initialization direction of modes 9 and 10 is positive if the origin switch is already activated at the beginning of the action;

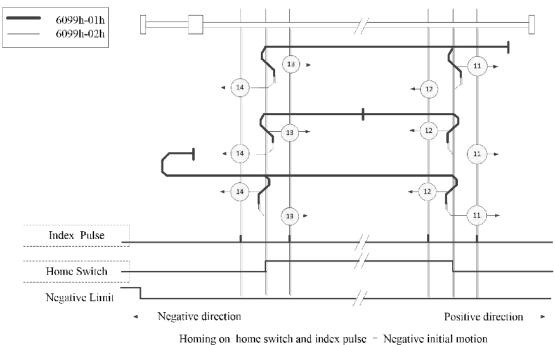

The initialization direction of modes 11 and 12 is positive if the origin switch is already activated at the beginning of the action;

The initialization direction of modes 13 and 14 is negative if the origin switch is already activated at the beginning of the action;

The final position returned to the origin is the Z-phase signal near the rising or falling edge of the origin switch.

Homing on home switch and index pulse - positive initial motion

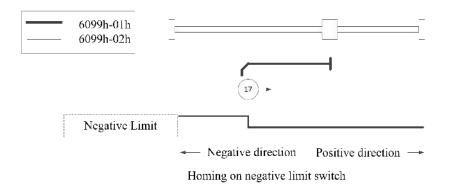

■ Method 17:

This method is similar to Method 1.

The difference is that the origin detection position is not the index pulse, but the position where the Limit switch changes. (Please refer to the following figure)

When NOT is not assigned, Homing error=1.

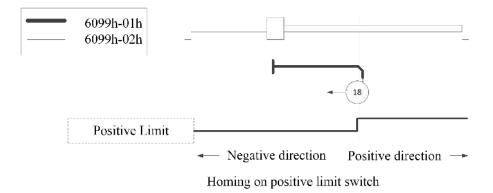

■ Method 18:

This method is similar to Method 2.

The difference is home detection position is not Index pulse. It is becoming the position where limit switch changed.

When POT is not allocated, Homing error = 1.

(Please refer to the figure below)

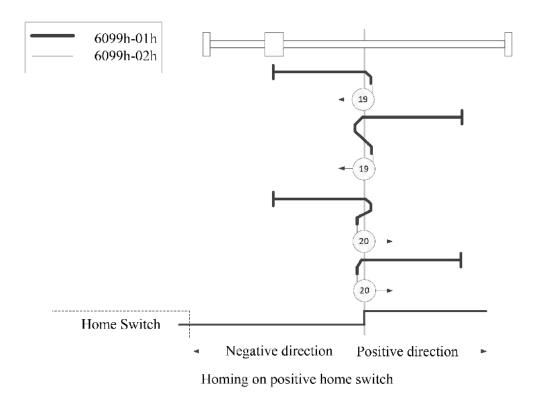

■ Method 19,20:

These methods is similar to Method 3 and 4.

The difference is home detection position is not Index pulse. It is becoming the position where Home switch changed.

When HOME is not assigned, homing error = 1.

(Please refer to the figure below)

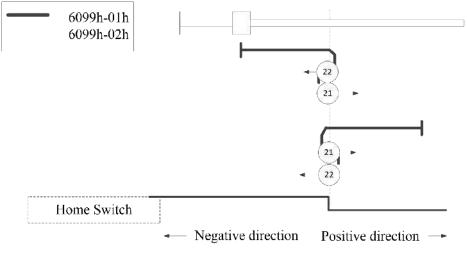

■ Method 21,22:

These methods is similar to Method 5 and 6.

The difference is home detection position is not Index pulse. It is becoming the position where Home switch changed.

When HOME is not assigned, homing error = 1.

(Please refer to the figure below)

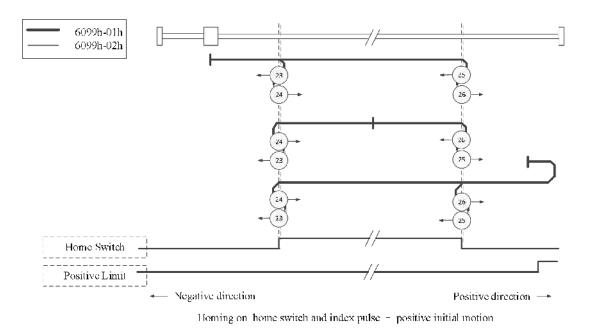

Homing on positive home switch and index pulse

■ Method 23,24,25,26:

These methods is similar to Method 7, 8, 9, 10.

The difference is home detection position is not Index pulse. It is becoming the position where Home switch changed.

When HOME,POT is not assigned, homing error = 1. (Please refer to the figure below)

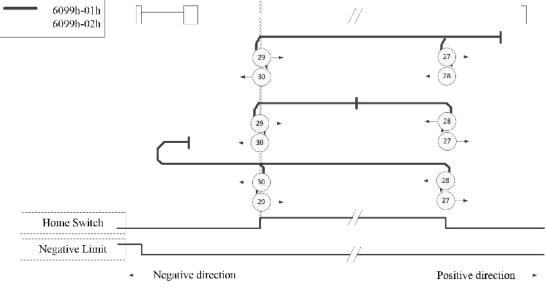

■ Method 27,28,29,30:

These methods is similar to Method 11,12,13,14.

The difference is home detection position is not Index pulse. It is becoming the position where Home switch changed.

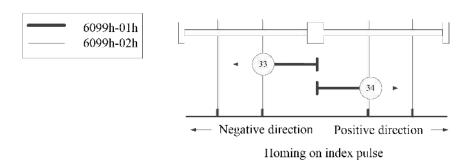

When HOME,NOT is not assigned, homing error = 1.(Please refer to the figure below)

Homing on home switch and index pulse - Negative initial motion

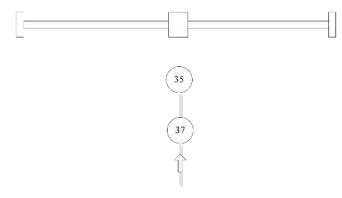

■ Method 33, 34:

Using methods 33 or 34, homing direction with negative or positive values, respectively. The original position is located near Z in the selected direction.

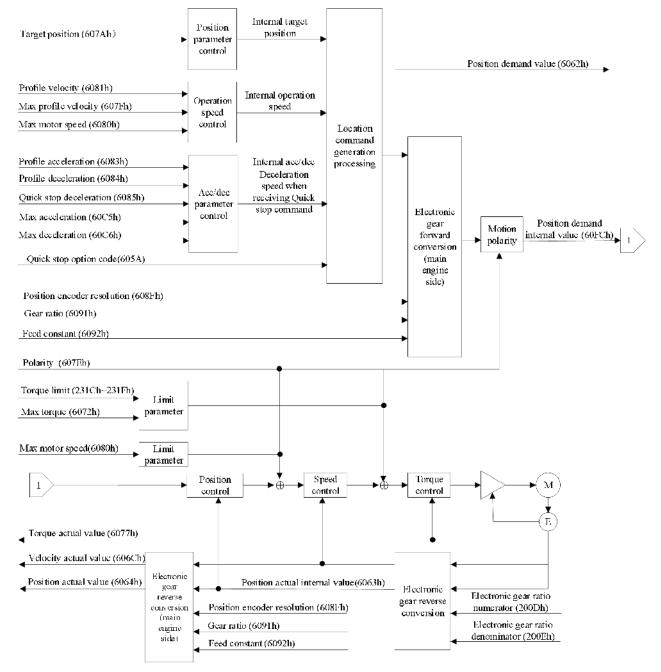

■ Method 35, 37:

In modes 35 and 37, the position after power on is the home position.

7.6 PP mode

PP (profile position control mode) is the position control mode that specifies the target position, target speed, acceleration/deceleration, etc., and acts after generating a position command in the servo driver. For this control mode, please check the communication cycle 500 µs or more.

Bit6	-4(operation mode	specific)	
Bit	Name	Value	Definition
		0 -> 1	Start the positioning action and trigger the setting value update.
4	new set-point		Get the new location determination task (607Ah (Target position), 6081h
			(Profile velocity), etc.).
		0	Complete the currently running positioning action. That is, during the
			movement, if the target position 607A, acceleration 6083, deceleration 6084
			are changed, and then the control command is sent, it will not operate
			according to the new movement parameters. It is necessary to send a new
	change set		command after the last movement is completed to execute the new movement.
5	immediately	1	Interrupt the current positioning action and immediately start the downward
	miniculatory		positioning action. That is, during the movement, the target position 607A,
			acceleration 6083 and deceleration 6084 are changed, and then the control
			command is sent. For example, after the control word $0x6f(111) \rightarrow 0x7F$
			(127) (relative mode) or $0x2F(47) \rightarrow 0x3f(63)$ (absolute mode) is changed,
			the system will immediately operate according to the new motion parameters.
6	absolute/relative	0	607Ah(target position) Process as absolute position
0	absolute/relative	1	607Ah(target position) Process as absolute position

Note:

(1) please do not change the acceleration and deceleration during motor operation (*).

If the acceleration and deceleration are changed, please change bit4 (new set point) from 0 to 1 after the motor stops.

6083h (Profile acceleration)

6084h (Profile deceleration)

60C5h (Max acceleration)

60C6h (Max deceleration)

(2) In the following status, if set point is executed (bit4 (new set-point) is changed from 0 to 1), please note that its positioning task is revoked.

--6081h (profile speed) = 0.

(3) if the driving prohibition in deceleration is detected according to halt = 1, all the positioning tasks are invalid.

(4) start the PP action, and keep it for more than 2ms until the next PP action is started (new set-point changes from 0 to 1).

		offset too large thresh	offset too large threshold) is above this parameter, if continue, set 6041h (Statusword)					
		bit13(following error)) to 1.					

3) pp control mode action

Action example 1:(basic set-point)

(1) For the master station, after setting the value of 607Ah (Target position), change the bit4 (new set point) of 6040h (control word) from 0 to 1. At this time, please also set 6081h (profile velocity).

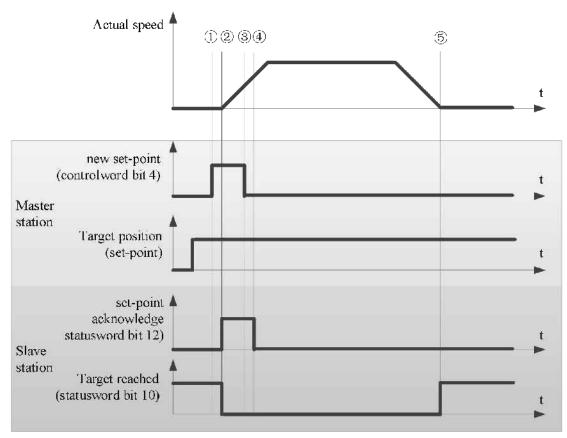

When 6081h (profile velocity) is 0, the motor does not act.

(2) For the slave station, confirm the rising edge $(0 \rightarrow 1)$ of bit4 (New set-point) of 6040h (control word), 607Ah (target position) as the target position to start positioning. At this time, bit12 (set point acknowledge) of 6041h (status word) is changed from 0 to 1.

(3) For the master station, confirm that bit12 (set-point acknowledge) of 6041h (status word) has changed from 0 to 1, bit4 (new set-point) of 6040h (control word) returns 0.

(4) For the slave station, confirm that the bit4 (new set-point) of 6040h (control word) has been 0, 6041h (status word) bit12 (set-point acknowledge) has changed to 0.

(5) when the target position is reached, the bit10 (target reached) of 6041h (control word) is changed from 0 to 1.

< Set-point example >

Note:

(1) 6081h (profile velocity) is limited by the smaller one of 607fh (max profile velocity) and 6080h (max motor speed).

(2) changing the set value of 607Fh (max profile velocity) or 6080h (max motor speed) in the action is not reflected in the action.

Action example 2: (Action data change without buffer: single set-point)

When bit5 (change set immediately) of 6040h (control word) is 1, if the data used for positioning action in the action has been changed, the current positioning action will be interrupted and the next positioning action will be started immediately.

(1) For the master station, confirm that the bit12 (set-point acknowledge) of 6041h (status word) is 0. After changing the value of 607Ah (target position), change the bit4 (New set-point) of 6040h (control word) from 0 to

Note: at this time, please do not change the acceleration and deceleration.

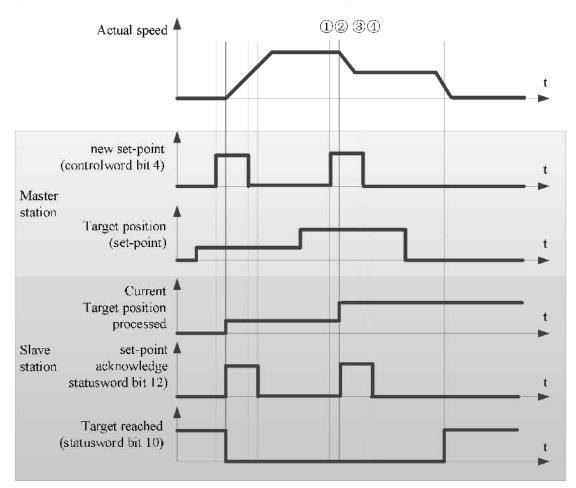

(2) For the slave station, confirm the rising edge $(0 \rightarrow 1)$ of bit4 (New set-point) of 6040h (control word), and update 607Ah (target position) as the new target position immediately. At this time, bit12 (set-point acknowledge) of 6041h (status word) is changed from 0 to 1.

(3) For master station, confirm that bit12 (set point acknowledge) of 6041h (status word) has changed from 0 to 1, bit4 (new set-point) of 6040h (control word) returns 0.

(4) For slave station, confirm that the bit4 (new set point) of 6040h (control word) has been 0, the bit12 (set point acknowledge) of 6041h (status word) is 0.

Note: 6081h (profile velocity) can be changed in the same steps (1) - (4).

After changing the 607Ah (target position) and 6081h (profile velocity), update the 607Ah (target position) and 6081h (profile velocity) simultaneously according to the above steps (1) - (4).

 \leq handshaking procedure for the single set-point method \geq

(1)bit10(target reached(Velocity reached)):

The difference between the total value of 60FFh (target velocity) and 60B1h (velocity offset) and 606Ch (velocity actual value) is within the range set by 606Dh (velocity window). If the time set by 606Eh (velocity window time) passes, the bit10 of 6041h (status word) becomes 1.

Bit	Name	Value	Definition	
10	Target reached	0	Halt = 0 (normal): speed control not completed	
			alt = 1 (stop according to halt): shaft in deceleration	
		1	Halt = 0 (normal): speed control completed	
			Halt = 1 (according to halt stop): shaft stop (shaft speed is 0)	

Index	Sub-index	Name	Unit	Range	Data	Access	PDO	OP-
					type			mode
606Dh	00h	Velocity window	Command unit	0~4294967295	U32	rw	RxPDO	PV

		The difference betwee offset) and 606Ch (ve time set by 606Eh (ve (status word) to 1 as to If the speed deviation becomes 0.	elocity actual va elocity window t the threshold val	lue) is within the s time) passes, set the lue.	set value he bit10	of this pa (target rea	arameter. 3) PV operations

- Profile velocity control mode generates a velocity command value according to the following parameters
- Target velocity(60FFh)

- Velocity offset(60B1h)
- Profile acceleration(6083h)
- Profile deceleration(6084h)
- Target speed is 60FFh(Target velocity)
- Speed feedforward is 60B1h(Velocity offset) cannot support now
- The update (sending) of action command is that after the servo enable is turned on, please input it after about 100ms.
- As test information, provide 606Ch (velocity actual value), etc.

• The 60FFh (target velocity) is limited by 607Fh (max profile velocity) and 6080h (max motor speed).

13	reserved	-	Not used

Action of TQ control mode

- The profile torque control mode generates torque command values based on the following parameters.
- Target torque(6071h)
- Torque offset(60B2h)(cannot support)
- Torque slope(6087h)
- For the operation command update(transmission), do input when approx 100ms has elapsed after the

servo ON(operation enabled command)

• As monitoring information, we provide 6077h(Torque actual value) etc.

- The 6071h (target torque) value is 6072h (max torque), 2312h (P3-28), 2313h (P3-29), which is limited by the minimum value.
- The speed is limited by 6080h (max motor speed).

7.9 Fly capture function

7.9.1 Function overview

To address the issue of insufficient production efficiency with traditional vision-based fixed-point photography, users in linear drive motor applications are increasingly adopting the vision "on-the-fly" photography feature. This function allows the system to move along a predetermined trajectory, capturing images instantaneously at designated points without stopping the motion axis. The process involves position comparison output, and throughout this operation, the moving mechanism never halts, thus saving operation time and ensuring efficiency and precision. This technique is widely used in the photovoltaic and 3C industries.

Parameter	Bit	Explanation	Default value	Setting range
	0	0: Not output to the terminal 1: Output from SO1	1(only can use SO1)	0-65535
P5-79 OCMP1(pulse output 1)	1	0: Output positive signal 1: Output negative signal	0	-
	2~3	-	-	-
P5-80	-	OCMP1 output pulse width (0.1ms) Pulse width according to the previous output width (0.1ms)	5	0-20000

7.9.2 Parameter setting

7.9.3 Bus parameter setting

Object word	Parameter	Туре	Function
B000h	Position comparison output allocation settings	UINT8 (RXPDO)	The comparison value corresponding to the position takes effect bit0: position 1 comparison value 1 takes effect, 0 does not take effect bit1: position 1 comparison value 2 takes effect, 0 does not take effect bit2: position 1 comparison value 3 takes effect, 0 does not take effect bit7: position 1 comparison value 7 takes effect, 0 does not take effect
B001h	Position comparison value 1	INT32	Set the comparison value for position comparison 1
B002h	Position	INT32	Set the comparison value for position comparison 2

When any comparator position is triggered, the comparison ends and the state bit 0 will be set to 0. (2) When set to 1-8 and the corresponding comparator set by B000h is activated, the comparison ends when the corresponding comparator position is triggered, and
B00Ah	OCMP1 output status	UINT8 (TXPDO)	bit0: 1 During action (automatically set to 1 after enabling), 0 action stops bit1: 1 trigger once completion status, 0 incompleted bit2~3: reserved bit4~7: The position of the triggered comparison value (valid when bit1 is 1)

7.9.4 Usage of the fly capture function

In the bus OP state, first set the P group parameters, allocate the SO pin to the OCMP output, then use the object word to set the effective bit of the position comparator (set B000h), and finally set the value of the position comparator. Bidirectional triggering.

Continuous comparison mode, with bit0 and bit1 set to 1 for OCMP output (B009h).

Single trigger mode, bit0 is set to 1 corresponding to the OCMP output (B009h), bit1 is set to 0, and bit4-7 selects the position point to stop comparing. When the position comparison point is triggered, bit0 of the OCMP output state will be set to 0, and it needs to be reset for the next use.

7.9.5 Fly capture application

• Allocate SO terminals and set pulse width (P5-79)

First set P5-79, assign SO1 pin to OCMP output, and then set P5-80 pulse width. For example: P5-79 is set to 0x0001, P5-80=50, which means that when the feedback position 6064h reaches the comparison position, the SO1 terminal outputs a forward 5ms pulse signal.

• Add the parameters related to fly capture to PDO

B000h (position comparison output allocation setting), B009h (OCMP output setting), B001h (position comparison value 1), B002h (position comparison value 2), Add B003h (position comparison value 3) and B00Ah (OCMP output status) are added to PDO, as shown in the I/O mapping below. The object word can be modified by modifying the HD register corresponding to the object word.

• Set the effective position of the position comparator (B000h) and the values of the position comparator (B001h~B008h)

Set the effective bit (B000h) of the position comparator corresponding to the position comparator that needs to be allocated to 1, and set the values of the position comparator (B001h~B008h). As shown in the figure below, the effective bit (B000h) of the position comparator is set to 7, that is, bit0~bit2 is set to 1, and position comparators 1-3 are enabled. Set three comparison points for the values of position comparators 1-3.

• OCMP output setting (B009h)

(1) Continuous comparison mode

This example compares three positions, namely positions 1-3.

Set the OCMP output setting (B009h) to 3 (0000 0011), that is, set the bit0 and bit1 of B009h to 1. In the bus OP state, when the feedback position 6064h reaches the comparison position, the SO1 terminal outputs a pulse signal.

In the above figure, the purple color represents the position value of the fly capture comparison point. Green B00Ah (OCMP1 output status): 1, 19, 35, 51

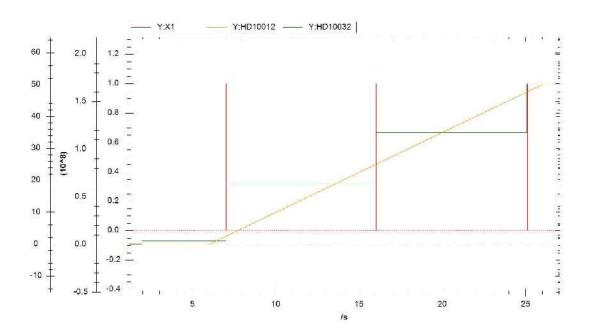

- **(**1**)** 0000 0001;
- **(**19**)** 0001 0011;
- **(**35**)** 0010 0011;
- **(**51**)** 0011 0011;

The red color SO1 output(fly capture signal) connected to the X1 input of the PLC. The yellow color represents the position feedback change of 6064h.

(2) Single triggering mode

This example compares three positions, namely positions 1-3.

Set the OCMP output (B009h) to 49(0011 0001), which is 0x31. In the bus OP state, when the feedback position 6064h reaches the comparison position 3, the SO1 terminal outputs a pulse signal, and the OCMP output state changes to the completed state (B00A.0=0). If you want to make a position comparison again, you need to reset the bit0 of B009h from 0 to 1 before it can take effect.

In the above picture, green B00Ah: 0, 1, 19, 35, 50.

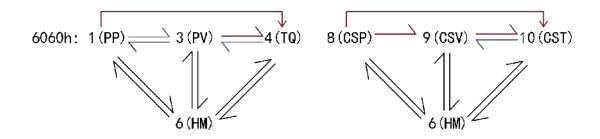

- **(**1**)** 0000 0001;
- 【19】0001 0011;
- **(**35**)** 0010 0011;
- **(**50**)** 0011 0010;

The red color SO1 output(fly capture signal) connected to the X1 input of the PLC. The yellow color represents the position feedback change of 6064h.

7.10 Mode common function

7.10.1 Mode mutual switching function

DS5C2 supports mode switching during runtime, with a mode switching time of 2ms. In the servo enabled state, it supports position mode switching to speed mode, position mode switching to torque mode, and speed mode switching to torque mode, making it convenient for users to achieve multi-mode switching control in project engineering.

7.10.2 Stop mode

PDS is a motor deceleration stop method for setting the main power supply interruption or alarm occurrence in the operation enabled state (servo enabled state).

The deceleration function (selection code) defined by COE (CIA402) and the deceleration function (free running stop, deceleration stop) on the servo (DS5C2) side are combined.

Deceleration stop examples according to alarm

A: if there is an alarm, it starts to slow down and stop. PDS status in deceleration is Fault reaction active.

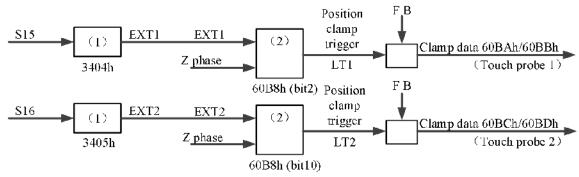

B: the motor stops when the actual speed is less than 10 r / min. PDS status after stop is Fault.

7.10.3 Touch Probe function(position clamp request/release)

The probe function is the position locking function. When the trigger condition (EXT1 / EXT2) is met, the probe function is triggered and the motor encoder value when the condition is triggered is locked. According to the setting of probe control word 60B8, single or multiple triggering can be realized.

Note:

- (1) Probe function is not supported in HM mode.
- (2) Currently, only external signals are supported as trigger sources.
- 1) Touch probe function composition

60B8h:Touch probe function 60BAh:Touch probe pos1 pos value 60BBh:Touch probe pos1 neg value 60BCh:Touch probe pos2 pos value

60BDh:Touch probe pos2 neg value

If the trigger position is at the same point of one rotation of the motor, theoretically, the difference between the two latched probe values shall be the number of pulses sent by the motor encoder for one rotation.

It should be noted that it takes a certain time from the generation of the external trigger signal to the driver receiving the signal and performing the latch operation. Therefore, the latch value of the probe must have an error with the actual value. The error is related to the motor speed, hardware performance and software processing.

Notes for function use:

Product model	Defaul	t value	Set when using probe function			
Product model	P5-62	P5-63	P5-62	P5-63 (terminal)		

			(terminal)	
DL6	0	0	1(SI1)	2(SI2)

• The clamping trigger signal uses external inputs (EXT1/EXT2), and P5-62 and P5-63 are terminal assignment parameters for Touch Probe1 and Touch Probe2 functions. The default parameters for the driver probe function are shown in the table above.

60B8h (Touch probe function)							
Bit10 LT2 Bit2 LT1							
0	EXT2	0	EXT1				
1	Z phase	1	Z phase				

- if the touch probe is executed to an unassigned port, E-883 (abnormal action protection) will occur.
- when the clamping trigger signal is an external input (EXT1/EXT2), the acquisition error occurs. Make the speed near the clamp signal input as low as possible.
- the width of input ON and OFF of clamping trigger signal shall be more than 2ms respectively.
- in the following cases, touch probe is invalid (cancelled). (the value of 60B9h is cleared).
 - (1) when ESM status is init
 - (2) switch to HM mode
- for the same touch probe, please do not set the rising edge and the falling edge at the same time. The action of setting the situation at the same time is unknown.
- it should be noted that it takes a certain time from the generation of external trigger signal to the reception of signal by driver and the execution of latch operation. Therefore, the value of probe latch must have error with the actual value, and the difference is related to the motor speed, hardware performance and software processing.

6) Startup of Touch probe action

When bit0 / bit8 of 60B8h (touch probe function) is from "0 (stop) \rightarrow 1 (start)", obtain various setting conditions (60B8h: bit1 ~ 7 / bit9 ~ 15), and start Touch probe action.

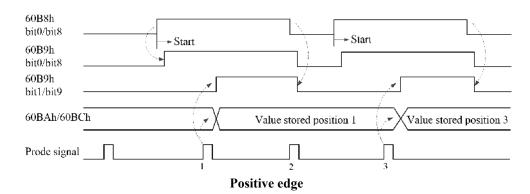

To make the changes of various setting conditions valid, bit0 / bit8 return "0 (stop)" and then to "1 (start)" again. To switch the control mode and then use the probe function, also bit0 / bit8 return "0 (stop)" and then to "1 (start)" again.

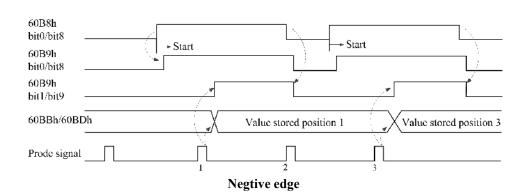

7) Touch probe event mode

According to 60B8h (Touch probe function) bit1/bit9 (event mode selection), "0(Trigger first event mode)" and "1(Continuous mode)" can be selected.

a. < Trigger first event mode>(60B8h:bit1=0 / bit9=0)

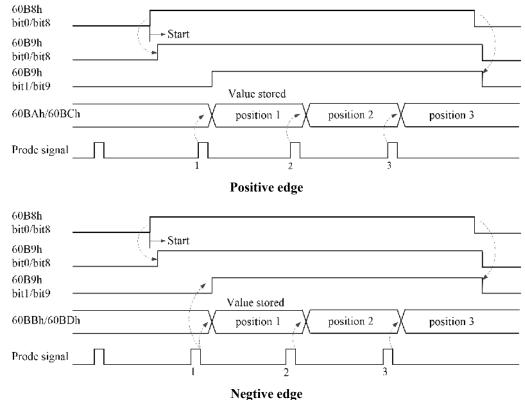

After starting, this mode only clamps position for the first trigger signal. In order to get it again, it is necessary to start touch probe again.

b. < Continuous mode >(60B8h:bit1=1 / bit9=1)

After startup, this mode clamps position for every trigger signal. The obtained value will be kept for the next Probe signal.

7.10.4 Digital input(60FDh)

The digital input 60FDh's bits are assigned to represent various function signals through the parameters of the DL6 series servo, specifically P5-22 (POT setting address), P5-23 (NOT setting address), P5-27 (HOME origin setting address), P5-62 (Probe 1 setting address), P5-63 (Probe 2 setting address), P5-72 (Remote SI input 1), P5-73 (Remote SI input 2), P5-74 (Remote SI input 3), and P5-75 (Remote SI input 4). These signals indicate the input states for the positive limit switch (POT), negative limit switch (NOT), home switch (HOME), Touch probe 1, Touch probe 2, and the remote input states 1 to 4.

Bits details:

Value	Description
0	Input status OFF
1	Input status ON

The values of bit0 (reverse overtravel switch), bit1 (forward overtravel switch), bit2 (origin switch), bit3 (probe 1), bit4 (probe 2) and bit5 (Z phase output), bit16 (remote SI input1), bit17(remote SI input2), bit18 (remote SI input3), bit19 (remote SI input4) for 60FD (digital input) represent the positive signal states of driving limit input, negative driving limit input, near origin input, probe 1 input, and probe 2 input, Z phase output, remote SI input1, remote SI input2, remote SI input3, remote SI input4, remote SI inp

The Z-phase output holding time is modified by the driver parameters:

Parameter	Meaning	Default value	Unit	Range	Modify	Effective
P5-19	Z-phase output holding time	2	ms	1~65535	Anytime	At once

The Z-phase output is affected by the EtherCAT communication cycle and its own software processing, resulting in poor consistency.

7.10.5 Digital output (60FEh)

The bit0 in sub object word 1 of digital output 60FEh represents the zero crossing Z-phase output status bit, and the bit0 in sub object word 2 represents the zero crossing Z-phase output enable bit. Set the Z-phase output enable bit to 1. When the encoder crosses zero, the Z-phase output status bit changes from 0 to 1. After the holding time set in P5-19, the Z-phase output status bit changes from 1 to 0. If the Z-phase output enable bit is set to 0, there is no Z-phase output state, and the value of the Z-phase output state bit is 0.

	02h	15 7 r = reserv roe1= ren	14 6 ed (Not con note output	r 13 5 respondi enable1	12 4 ng) (remote s	r 19 11 r 3 r	18 roe3 10 2 enable 1	17 roe2 9 1	16 roe1 8	

The details of each bit are as follows:

bit	Name	Value	Description
16	Parrata SQ1 autrust status hit	0	Remote SO1 status OFF
	Remote SO1 output status bit	1	Remote SO1 status ON
17	Remete SO2 entruit status hit	0	Remote SO2 status OFF
17	Remote SO2 output status bit	1	Remote SO2 status ON
18	Remete SO2 autout status hit	0	Remote SO3 status OFF
	Remote SO3 output status bit	1	Remote SO3 status ON

Subindex 02h: Bit mask

bit	Name	Value	Description
16	Remote SO1 output enable bit	0	Remote SO1 output enable OFF

bit	Name	Value	Description
		1	Remote SO1 output enable ON
17	Remote SO2 output enable bit	0	Remote SO2 output enable OFF
17		1	Remote SO2 output enable ON
10	Demote SO2 output enchie hit	0	Remote SO3 output enable OFF
18	Remote SO3 output enable bit	1	Remote SO3 output enable ON

The bits 16, 17, and 18 in Subindex 01h (sub object word 1) of digital output 60FEh represent the remote SO1 output status bit, remote SO2 output status bit, and remote SO3 output status bit, respectively. The bits 16, 17, and 18 in Subindex 02h (sub object word 2) represent the remote SO1 output enable bit, remote SO2 output enable bit.

7.10.6 Position information

1) Initialization time of location information

The servo driver initializes (presets) the position information related objects in the following time sequence.

- Initialization sequence (condition):
 - When the power is put into operation
 - When communication is established (ESM status Init \rightarrow OP migration)
 - When the original point is reset
 - Absolute multi-turn zero clearing
- Initialization objects
 - 6062h(Position demand value)
 - 6063h(Position actual internal value)
 - 6064h(Position actual value)
 - 60FCh(Position demand internal value)

The object here is based on the Position actual internal value (6063h) that represents the feedback position of the motor, the electronic gear function described later will add Home offset, etc. according to the polarity change symbol, and initialize (preset) when the communication is established.

In addition, the changes of the set values of electronic gear ratio, Polarity and Home offset are reflected by the time sequence described later in this chapter.

Note: please refer to "initialization of absolute encoder" in Section 4 of this chapter for details of precautions for using absolute encoder.

2) Electronic gear ratio

(1) Function overview

The electronic gear is a function of multiplying the position command input from the upper computer by the electronic gear ratio set by the object as the position command of the position control unit. According to the use of this function, the motor rotation and movement amount of each command unit can be set arbitrarily.

(2) DL6 series electronic gear ratio setting method

Method 1: set the electronic gear ratio according to the internal parameters of the servo, please refer to chapter 5.4.1.1 for details.

Method 2:

DS5C2 series servo driver can set electronic gear ratio through the object 608Fh (Position encoder resolution), 6091h (Gear ratio), 6092h (Feed constant) specified by CoE (CiA402).

The following is mainly about setting the electronic gear ratio according to COE (CiA402). The relationship between user-defined units (instruction units) and internal units (pulse) is calculated according to the following equation.

Calculation formula of electronic gear ratio:

 $Electronic gear ratio = \frac{Position encoder resolution \times Gear ratio}{Feed constant}$

Position encoder resolution = $\frac{608F: 01(encoder increments)}{608F: 02(motor revolutions)}$

Gear ratio = $\frac{6091: 01(Motorrevolutions)}{6091: 02(Shaftrevolutions)}$

Feed constant - 6092: 01(Feed) 6092: 02(Shaftrevolutions)

Position demand value(6062h)×electronic gear ratio=Position demand internal value(60FCh)

Note:

(1) The ratio of electronic gear is valid in the range of 8000 to 1/1000 times.

If the out of range value is saturated within the range, E-883 (abnormal action abnormal protection) occurs.

(2)608FH-01h (encoder increments) is automatically set according to the resolution of the encoder. The factory value of 6092h-01h (feed) is set according to the resolution of encoder.

(3) The setting of electronic gear ratio is reflected by the following time sequence.

- When the power is put into operation
- When communication is established (ESM status Init \rightarrow OP migration)
- When the original point is reset
- Absolute multi-turn zero clearing
- (4) Please note that it does not reflect whether the set value of the associated object changes or not.

The position information initialization when Init \Rightarrow OP in absolute mode, please set the value of absolute

encoder position [pulse / unit] / electronic gear ratio within the range of - 2^31 (- 2147483648) $\sim + 2^31-1$ (2147483647). Actions outside this range are not guaranteed.

Please confirm the action range of absolute encoder position and gear ratio.

- (5) Try to use the electronic gear ratio setting in Cia402 protocol.
- (6) Linear motor 6099-01h: 609-02h is fixed at a 1:1 ratio.
 - Related parameter

Position encoder resolution(608Fh)

Index	Sub-index	Name	Units	Range	Data	Access	PDO	OP-
					type			mode
608Fh	-	Position encoder	-	-	-	-	-	-
		resolution						
		The resolution of encoder is	s set automa	tically.				

0.01	II ¹ 1 4 1 1		2	T TO		NO	A T T
00h	Highest sub-index	-	2	U8	ro	NO	ALL
	supported						
	Represents the Sub-Indexes of 608FH.						
01h Encoder increments		Pulse	1~4294967295	U32	ro	NO	ALL
	Indicates the amount of enc	oder movem	ent. Value is set a	utomatica	lly by the	encode	r
	resolution.						
02h	Motor revolutions	r(motor)	1~4294967295	U32	ro	NO	ALL
Indicates the number of motor rotations. The value is fixed to 1.							

This object defines the encoder resolution for each polar distance of the motor during operation.

Position encoder resolution = Encoder increments(608Fh-01h)/ Motor revolutions (608Fh-02h)

This object is automatically set based on manually set motor information.

Example: encoder resolution 1µm, polar distance 20mm

608Fh-01h(Encoder increments)=20000

608Fh-02h(Motor revolutions)= 1

Position encoder resolution =20000 / 1 = 20000. When the linear encoder moves one polar distance (N-N), the encoder position changes by 20000 units.

Gear ratio (6091h)

Index	Sub-	Name	Units	Range	Data	Access	PDO	OP-
	index				type			mode
6091h	-	Gear ratio	-	-	-	-	-	-
		Set gear ratio						
	00h	Highest sub-index	-	2	U8	ro	NO	ALL
		supported						
		Represents the Sub-Indexe	es of 6091H.					
	01h	Motor revolutions	Pulse	1~4294967295	U32	rw	NO	ALL
		Motor rotation numbers.						
	02h	Shaft revolutions	r(motor)	1~4294967295	U32	rw	NO	ALL
		Shaft rotation numbers.						

For this object, Gear ratio = Motor shaft revolutions(6091h-01h)/ Driving shaft revolutions(6091h-02h), linear motor fixed at 6091-01h: 6092-02h=1: 1.

Feed constant(6092h)

Index	Sub-	Name	Units	Range	Data	Access	PDO	OP-
	index				type			mode
		Feed constant	-	-	-	I	-	-
	-	Set the feed constant.						
	0.01	Highest sub-index supported	-	2	U8	ro	NO	ALL
6092h	00h	Represents the Sub-Indexes of	f 6092h.					
009211	01h	Feed	Command unit	1~4294967295	U32	rw	NO	ALL
	0111	Set the feed quantity.						
	024	Shaft revolutions	r (motor)	1~4294967295	U32	rw	NO	ALL
	02h	Set the shaft rotation number (linear motor fix	ed to 1)				

This object represents the amount movement of shaft moving one polar distance after the output of the gearbox. Feed constant =Feed(6092h-01h)/ Driving shaft revolutions(6092h-02h)

3) Polarity function (607Eh)

For position commands, speed commands, torque commands, and their offsets, polarity (motor rotation direction) can be set. The DL6 series sets the rotation direction based on the object Polarity command polarity (607Eh) specified by CoE (CiA402). But the polarity of the Polarity command (607Eh) specified by CoE (CiA402) will change with the change of the rotation direction of parameter P0-05 (rotation direction setting). If P0-05 is set from 0 to 1 and Cia402 object word 607Eh becomes 0xE0, the driver can move in the opposite direction. P0-05 is set from 1 to 0, its object word 607Eh becomes 0, and the drive returns to the default specified positive direction motion.

In addition, the Polarity instruction polarity (607Eh) of the object is not the object of the original replacement parameter P0-05 (rotation direction setting). It is valid when transferring object data corresponding to the table below between the CoE (CiA402) processing unit and the motor control processing unit.

Index	Sub-	Na	ame	Units	Range	Data	Access	PDO	OP-mode

				• 6	071h (Target	torque)				

	• 60B2h (Torque offset)	
<monitor></monitor>	 6062h(Position demand value) 	
	 6064h(Position actual value) 	
	 606Bh(Velocity demand value) 	
	 606Ch(Velocity actual value) 	
	• 6074h(Torque demand)	
	6077h(Torque actual value)	
	 6078h(Current actual value) 	

Symbol no reversal: for the positive direction command, the motor rotation reverse direction is CCW direction; Symbol has reversal: for the positive direction command, the motor rotation reverse direction is CW direction. When the rotation direction of the motor is viewed from the shaft end of the load side, CW is defined as clockwise and CCW is defined as anticlockwise.

4) Position range limit (607Bh)

The DL6 series servo driver does not support wrap-around.

Infinite rotation mode acts as 607Bh-01h=80000000h, 607Bh-02h=7FFFFFFh in the interior. Modifying this object is not affected either.

5) Homing offset(607Ch)

Set the offset quantity of the mechanical origin offset after returning to the mechanical origin, and use this position as the mechanical zero point. If it is set to 0, the mechanical origin will coincide with the mechanical zero point. The origin offset can be set as a positive or negative number to indicate the left or right deviation from the mechanical origin.

This object can be updated at any time, but it needs to reflect the actual location information through the following time sequence.

- \cdot When the power is put into operation
- When communication is established (when ESM status is Init \rightarrow OP migration)
- When the original point is reset

The position under the above time sequence is used as the reference to initialize(preset) the following objects

• When the origin position is detected

6063h(Position actual internal value)=60FCh(Position demand internal value)=06062h(Position demand value)=6064h(Position actual value)=607Ch(Home offset)

• Initialization (preset) in time sequence other than the origin position is detected

6063h(Position actual internal value)=60FCh(Position demand internal value) 6062h(Position demand value)=6064h(Position actual value)

=6063h(Position actual internal value)+607Ch(Home offset)

Note: the above is the case when the electronic gear ratio is 1:1 and there is no polarity reversal.

Home offset definition

Home position: Index pulse position (origin position)

Zero position: Incremental system = 0 (The position when the power is on, or the position from hm detected index pulse substract by Home offset position)

Absolute system=Zero position of absolute encoder.

7.10.7 Overtravel function in Ethercat mode

Parameter	Meaning	Default value	Unit	Range	Modify	Effective
P0-28.0	0: Direct alarm, using servo deceleration shutdown method 1: Alarm after decelerating and stopping as 605Ah mode 2: Do not use overtravel	2	-	0~3	0	1 3 4 8 9 10

Prohibited status

Scenario 1:

When the servo is in an enabled not motion or disabled state and touches the reverse limit switch, the panel will display NOT, cancel the reverse limit signal, and the panel will return to its previous state.

Scenario 2:

When the servo is in an enabled not motion or disabled state and touches the forward limit switch, the panel will display POT, cancel the forward limit signal, and the panel will return to its previous state.

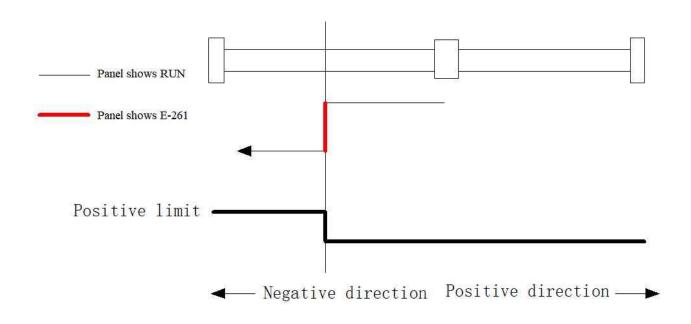

Scenario 3:

When the servo is in an enabled not motion or disabled state and simultaneously touches the forward and reverse limit switches, the servo will report E-261. If two limit signals are cancelled, the panel will return to its previous state; If any limit signal is cancelled, the panel will display another limit signal, which needs to be cancelled before the panel can return to its previous state.

■ Normaly operation status

(1) Initial movement direction to the left

The initial direction of movement is left. When touching the forward limit switch, the servo will report E-261. If the forward limit switch is cancelled first, and then the alarm is cleared, the shaft will return to a non enabled state, and both the forward and reverse directions of the shaft can move; If the alarm is cleared first and the axis returns to the disabled state, but the panel still displays POT, the axis is still in the forward limit restricted state. The forward limit signal needs to be cancelled in order to release the forward overtravel prohibition.

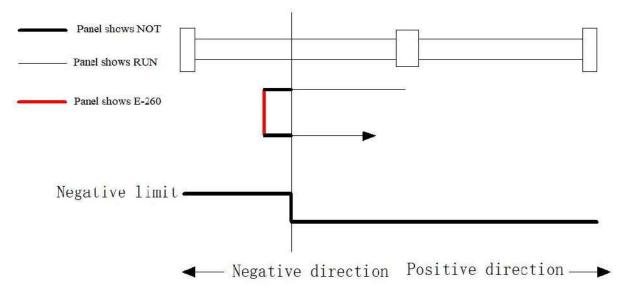

Overtravel status

P0-28 set to 1 (Alarm deceleration stop)

(1) Initial movement direction to the left, triggering the overtravel signal without occurrence of offside Scenario 1: Failure to touch the forward limit switch

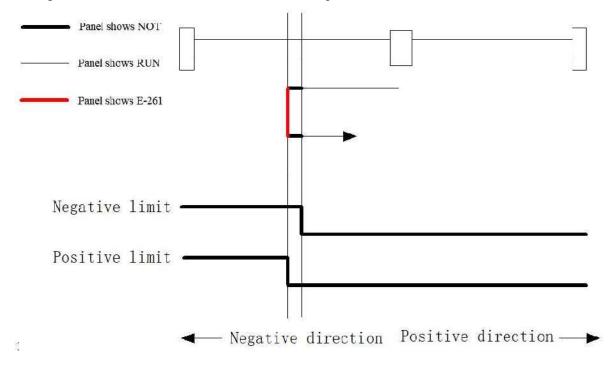

The initial direction of movement is left. When touching the rising edge of the reverse limit switch, the panel display changes from RUN to NOT, triggering the reverse overtravel deceleration stop. The shaft stops on the reverse limit switch, and the servo will report E-260. The alarm must be cleared to move the axis in the forward direction. When it touches the falling edge of the reverse limit switch, the panel display can change from NOT to RUN, and the reverse overtravel prohibition can be released.

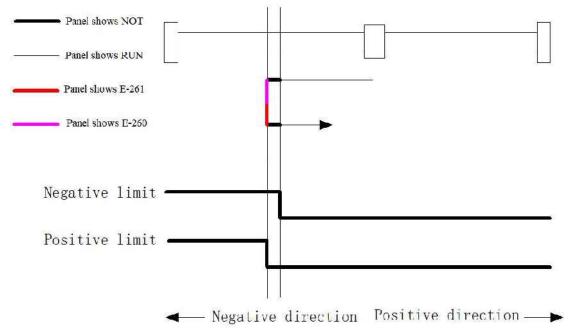

Scenario 2: Before the axis deceleration stops, touch the forward limit switch

The initial direction of movement is left. When touching the rising edge of the reverse limit switch, the panel display changes from RUN to NOT, triggering the reverse overtravel deceleration stop. Before the shaft stops, if the forward limit switch is touched, the servo will report E-261. The forward limit switch

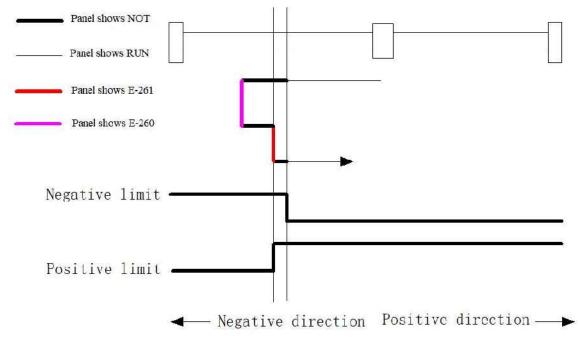

must be cancelled in order to clear the E-261 alarm. Otherwise, the alarm cannot be cleared. Then, the shaft moves forward and touches the falling edge of the reverse limit switch. Only then can the panel display change from NOT to RUN, and the reverse overtravel prohibition be released.

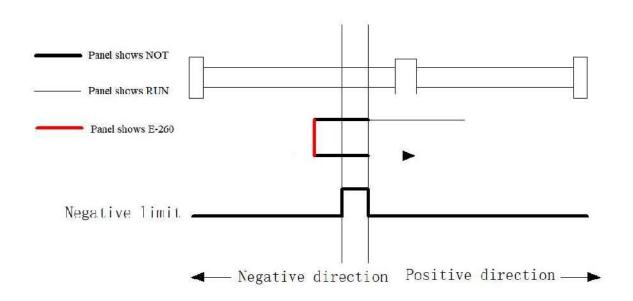

Scenario 3: When the shaft stops at the negative limit switch and touches the positive limit switch The initial direction of movement is left. When touching the rising edge of the reverse limit switch, the panel display changes from RUN to NOT, triggering the reverse overtravel deceleration stop. When the shaft stops on the reverse limit switch, the servo will report E-260. At this time, if the forward limit switch is touched, the servo will report E-261. The forward limit switch must be cancelled before the E-261 alarm can be cleared. Otherwise, the alarm cannot be cleared. Then, when the shaft moves forward and touches the falling edge of the reverse limit switch, the panel display can change from NOT to RUN, and the reverse overtravel prohibition can be released.

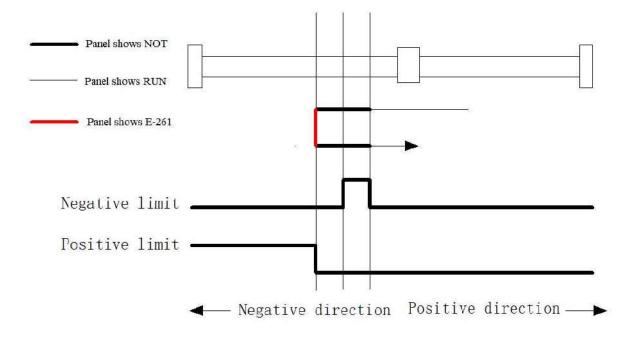

Scenario 4: When touching the forward limit switch during axis forward movement The initial direction of movement is left. When touching the rising edge of the reverse limit switch, the panel display changes from RUN to NOT, triggering the reverse overtravel deceleration stop. When the shaft stops on the reverse limit switch, the servo will report E-260. After clearing the alarm to make the shaft move forward, if the forward limit switch is touched, the servo will report E-261. The forward limit switch must be cancelled before the E-261 alarm can be cleared. Otherwise, the alarm cannot be cleared. Continue to move the shaft forward, touch the falling edge of the reverse limit switch, and the panel display can change from NOT to RUN to release the reverse overtravel prohibition.

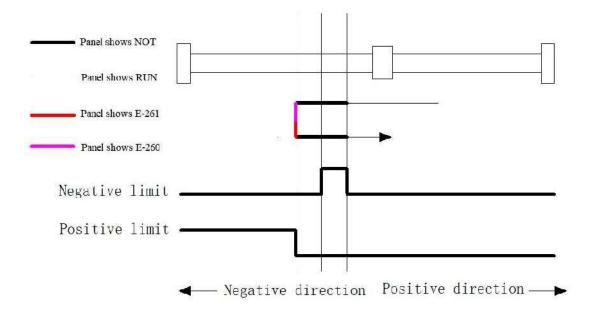

(2) The initial movement direction is to the left, triggering an overtravel signal and out of range occured Scenario 1: Without touching the forward limit switch while offside The initial direction of movement is to the left. When touching the rising edge of the reverse limit switch, the panel display changes from RUN to NOT, triggering the reverse overtravel deceleration stop. However, the axis crosses the reverse limit switch and triggers the falling edge of the reverse limit switch. The axis stops outside the limit, and the servo will report E-260. The alarm must be cleared to make the axis move forward. Touch the rising and falling edges of the reverse limit switch again before the panel display can change from NOT to RUN, and the reverse overtravel prohibition can be released.

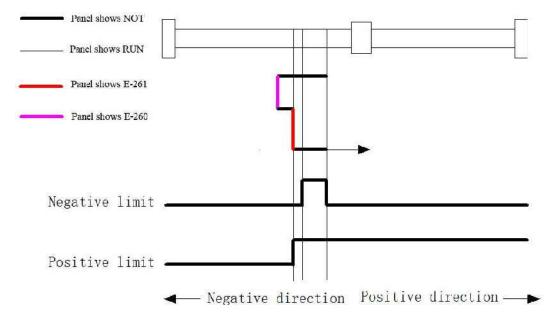

Scenario 2: In the case of offside, touch the forward limit switch before the axis deceleration stop is completed The initial direction of movement is left. When touching the rising edge of the reverse limit switch, the panel display changes from RUN to NOT, triggering the reverse overtravel deceleration stop. However, the axis crosses the reverse limit switch and triggers the falling edge of the reverse limit switch. Before the shaft stops, if the forward limit switch is touched, the servo will report E-261. The forward limit switch must be cancelled in order to clear the E-261 alarm. Otherwise, the alarm cannot be cleared. Then, the shaft moves forward and touches the rising and falling edges of the reverse limit switch again. Only then can the panel display change from NOT to RUN, and the reverse overtravel prohibition be released.

Scenario 3: In the case of offside, when the shaft stops, touch the forward limit switch The initial direction of movement is left. When touching the rising edge of the reverse limit switch, the panel display changes from RUN to NOT, triggering the reverse overtravel deceleration stop. However, the axis crosses the reverse limit switch and triggers the falling edge of the reverse limit switch. When the shaft stops, the servo will report E-260. At this time, if the forward limit switch is touched, the servo will report E-261. The forward limit switch must be cancelled before the E-261 alarm can be cleared. Otherwise, the alarm cannot be cleared. Then, the shaft will move forward and touch the rising and falling edges of the reverse limit switch again. Only then can the panel display change from NOT to RUN, and the reverse overtravel prohibition be released.

Scenario 4: In the case of offside, touching the forward limit switch during axis forward movement The initial direction of movement is left. When touching the rising edge of the reverse limit switch, the panel display changes from RUN to NOT, triggering the reverse overtravel deceleration stop. However, the axis crosses the reverse limit switch and triggers the falling edge of the reverse limit switch. When the shaft stops, the servo will report E-260. After clearing the alarm to move the shaft forward, if the forward limit switch is touched, the servo will report E-261. The forward limit switch must be cancelled before the E-261 alarm can be cleared. Otherwise, the alarm cannot be cleared. Continue to move the shaft forward, touch the rising and falling edges of the reverse limit switch again, and the panel display can change from NOT to RUN to release the reverse overtravel prohibition.

7.10.9 Cascade alarm function

When this function is enabled, if the terminal signal is conductive, the driver will generate an alarm E-320.

The driver can be used in cascade, and by connecting the alarm output to this functional terminal of the next driver, a cascade alarm can be triggered.

Parameter	Meaning	Default value	Unit	Range	Modify	Effective
P5-68	Terminal emergency alarm function	0	-	00~ff	Anytime	At once

New function parameter P5-68, default setting of P5-68 to 0:

8 Object dictionary

This chapter mainly introduces the object dictionary area allocation, COE communication area, driver profile area and so on.

8.1 Object dictionary area assignment

All objects are configured in the object dictionary of each group through 4 digits 16-bit index configuration address.

The object dictionary of CoE (CANopen over EtherCAT) specified by CiA402 and the object dictionary of DL6 series are as follows:

Object dictionary specified by CiA402		DS5C2 series object dictionary		
Index	Content	Index	Content	
$0000h{\sim}0FFFh$	Data type area	$0000h{\sim}0FFFh$	Data type area	
$1000h\sim$ 1FFFh	COE communication area	$1000h{\sim}1FFFh$	COE communication area	
$2000h{\sim}5FFFh$		2000h~2FFFh	Servo parameter area	
	Fastary austan ana	3000h~3FFFh	Reserved	
	Factory custom area	4000h~4FFFh	Reserved	
		5000h~5FFFh	Reserved

This section describes the equipment information.

8.2.3 Sync manager communication type(1C00h)

The action mode assigned to each SyncManager is set by 1C00h object. The value is fixed for the servo driver.

Index	Sub-index	Name/Description	Range	DateType	Access	PDO	Op-mode
1C00h	00h	Number of used sync manager	0~255	U8	ro	TxPDO	All
1000m	0.011	channels	0 200		10	THE DO	
		Represents the object subindexes. The	value is fiz	ked to 04H.			
	01h	Communication type sync manager 0	0~4	U8	ro	TxPDO	All
		Set the purpose of SYNC Manager 0.		1		1	
		0: unused					
		1: Mailbox receive message (master sta	tion→slav	ve station)			
		2: Mailbox send message (slave station	→master	station)			
		3: RxPDO (master station→slave statio	on)				
		4: TxPDO (slave station→master statio	n)				
		Because SYNC Manager0 uses mailbox	x to receiv	e messages,	the value	is fixed to	1.
	02h	Communication type sync manager 1	0~4	U8	ro	TxPDO	All
		Set the purpose of SYNC Manager 1.					
		0: unused					
		1: Mailbox receive message (master sta	tion→slav	ve station)			
		2: Mailbox send message (slave station	→master :	station)			
		3: RxPDO (master station→slave statio	on)				
		4: TxPDO (slave station→master statio	-				
		Because SYNC Manager1 uses mailbox	x to send r	nessages, the	value is	fixed to 2.	
	03h	Communication type sync manager 2	0~4	U8	ro	TxPDO	All
		Set the purpose of SYNC Manager 2.					
		0: unused					
		1: Mailbox receive message (master sta					
		2: Mailbox send message (slave station		station)			
		3: RxPDO (master station→slave station)	,				
		4: TxPDO (slave station→master statio					
		Because SYNC Manager2 uses Process	-		, the value	1	
	04h	Communication type sync manager 3	0~4	U8	ro	TxPDO	All
		Set the purpose of SYNC Manager 3.					
		0: unused					
		1: Mailbox receive message (master sta		· · · · · ·			
		2: Mailbox send message (slave station		station)			
		3: RxPDO (master station \rightarrow slave statio	,				
		4: TxPDO (slave station \rightarrow master statio			.1 1	· · · 1 ·	4
		Because SYNC Manager3 uses Process	data outp	out (RxPDO)	, the value	e is fixed to	94.

8.2.4 PDO mapping

1. PDO distribution object $(1C12h \sim 1C13h)$

The table for PDO mapping allocated by the syncmanager is set by the objects 1C12h to 1C13h.

Index	Sub-index	Name/Description	Range	DateType	Access	PDO	Op-mode
1C12h	00h	Number of assigned PDOs	0~4	U8	rw	NO	All
		Represents the subindexes fo	r this object.				
	01h	Assigned RxPDO 1	1600h~1603h	U16	rw	NO	All
		Specifies the RxPDO mappin	ng object.				
	02h	Assigned RxPDO 2	1600h~1603h	U16	rw	NO	All
		Specifies the RxPDO mappin	ng object.				
	03h	Assigned RxPDO 3	1600h~1603h	U16	rw	NO	All
		Specifies the RxPDO mappin	ng object.				
	04h	Assigned RxPDO 4	1600~1603	U16	rw	NO	All
		Specifies the RxPDO mappin	ng object.				
1C13h	00h	Number of assigned PDOs	0~4	U8	rw	NO	All
		Represents the object subinde	exes. The value is	fixed to 04H.			
	01h	Assigned TxPDO 1	1A00h~1A03h	U16	rw	NO	All
		Specifies the TxPDO mappin	ig object.				
	02h	Assigned TxPDO 2	1A00h~1A03h	U16	rw	NO	All
		Specifies the TxPDO mappin	ig object.				
	03h	Assigned TxPDO 3	1A00h~1A03h	U16	rw	NO	All
		Specifies the TxPDO mappin	ig object.				
	04h	Assigned TxPDO 4	1A00h~1A03h	U16	rw	NO	All
		Specifies the TxPDO mappin	ig object.				

Sub-index 01h-04h of 1C12h and 1C13h can only be changed when the ESM state is PreOP and sub-index 00h = 0. Other status will return port code (06010003h).

After the settings changed, set the Sub-index number of Sub-index 00h. PDO allocation object settings are reflected by changing ESM status to SafeOP.

2.PDO mapping object (1600h~1603h, 1A00h~1A03h)

As a table for PDO mapping objects, 1600h-1603h for RxPDO and 1A00h-1A03h for TxPDO can be used. After subindex 01h, it represents the information of the mapped application layer object.

Index	Sub-Index		Name	e/Description	Range	DateType	Access	PDO	Op-mode
1600h	00h		Numł	per of entries	0~4294967295	U8	rw	NO	All
		Rep	resents	the subindexes for	r this object.				
	01h	1s	t receiv	ve PDO mapped	0~4294967295	U32	rw	NO	All
		Set	the firs	t mapping object.					
			bit	31 16	158	7	0		
				Index number	Sub-index number	r Bit le	ngth		
	02h	2n	d recei	ve PDO mapped	0~4294967295	U32	rw	NO	All
		The	setting	g method is same to	Subindex01h.				

Index	Sub-Index	Name/Description	Range	DateType	Access	PDO	Op-mode
	03h	3rd receive PDO mapped	0~4294967295	U32	rw	NO	All
		The setting method is same to	Subindex01h.				
	04h	4th receive PDO mapped	0~4294967295	U32	rw	NO	All
		The setting method is same to	Subindex01h.				
	05h	5th receive PDO mapped	0~4294967295	U32	rw	NO	All
		The setting method is same to	Subindex01h.				
	06h	6th receive PDO mapped	0~4294967295	U32	rw	NO	All
		The setting method is same to	Subindex01h.				
	16h	16th receive PDO mapped	0~4294967295	U32	rw	NO	All
		The setting method is same to	Sub-index01h.				
1601h	-	Receive PDO mapping 2, Sub	-index specificatio	n is same to 1	l 600h.		
1602h	-	Receive PDO mapping 3, Sub-index specification is same to 1600h.					
1603h	-	Receive PDO mapping 4, Sub	-index specificatio	n is same to 1	l 600h.		

Do not map duplicate objects. The change of repeated setting is not guaranteed.

Sub-index 01h-18h of 1600h-1603h can only be changed when the ESM state is PreOP and Sub-index 00h = 0. Other status will return Abort Code (06010003h).

After the settings changed, set the Sub-index number of Sub-index 00h. PDO allocation object settings are reflected by changing ESM status to SafeOP.

Index	Sub-Index		Name	e/Description	Range	DateType	Access	PDO	Op-mode
1A00h	00h		Num	ber of entries	0~4294967295	U8	rw	NO	All
		Repr	resents	the subindexes for	this object.				
	01h	1st	transr	nit PDO mapped	0~4294967295	U32	rw	NO	All
		Set t	he firs	t mapping object.	· · · · · ·				
			bit	31 16	158	7	. 0		
				Index number	Sub-index number	r Bit le	ngth		
	02h	2nd	l trans	mit PDO mapped	0~4294967295	U32	rw	NO	All
		The	setting	g method is same to	Subindex01h.

		The	The setting method is same to Subindex01h.						
	04h	4th	transi	nit PDO mapped	0~4294967295	U32	rw	NO	All
		The	setting	g method is same to	Subindex01h.				
	05h	5th	transı	nit PDO mapped	0~4294967295	U32	rw	NO	All
		The	setting	g method is same to	Subindex01h.				
	06h	6th	transı	nit PDO mapped	0~4294967295	U32	rw	NO	All
		The	setting	g method is same to	Subindex01h.				
	16h	16th	6th transmit PDO mapped 0~4294967295 U32 rw NO All						All
		The	The setting method is same to Subindex01h.						
1A01h	-	Tran	Transmit PDO mapping 2, Subindex specification is same to 1600h.						
1A02h	-	Tran	smit F	DO mapping 3, Su	bindex specification	n is same to	1600h.		

1A03h	-	Transmit PDO mapping 4, Subindex specification is same to 1600h.

Do not map duplicate objects. The change of repeated setting is not guaranteed.

Subindex 01h-18h of 1A00h-1A03h can only be changed when the ESM state is PreOP and Subindex00h = 0. Other status will return Abort Code (06010003h).

After the settings changed, set the Subindex number of Subindex00h. PDO allocation object settings are reflected by changing ESM status to SafeOP.

8.2.5 Sync manager 2/3 synchronization (1C32h, 1C33h)

Sync manager2 setting is executed according to 1C32h (Sync maneger 2 synchronization).

Sync manager3 setting is executed according to 1C33h (Sync maneger 3 synchronization).

Sync manager 2 synchronization(1C32h)

Index	Sub-Index	Name / Description	Range	DateType	Access	PDO	Op-mode			
1C32	00h	Number of entries	0~20h	U8	ro	NO	All

8.4.2 PDS(Power Drive Systems)specification

According to the user command or abnormal detection, the state transition of the PDS associated with the power control of the servo driver is defined as follows.

After migrating to Operation enabled, please increase the time to more than 100ms and input the action command. The following table shows the PDS state migration events (migration conditions) and actions during migration. For the migration of PDS, the status migration is performed at the same time as the handshake is obtained (through 6041h: Statusword, confirm the status has been converted, and then send the next migration instruction).

PDS conversion		Event	Action		
0		After the power supply is put into operation, or after			
	Auto skip 0	the application layer is reset, it will automatically	into operation, or after the		
		migrate.	application layer is reset, it will		

			automatically migrate.
1	Auto skip 1	Automatic conversion after initialization.	Communications are established.
2	Shut down	The condition of receiving the Shutdown instruction.	Nothing special
3	Switch on	When the power supply is on, the condition of receiving the Switch on command.	Nothing special
4	Enable operation	The condition of receiving the Enable operation instruction.	The driver function is effective. In addition, all previous Set point data are cleared.
5	Disable operation	The condition of receiving the Disable operation instruction.	Invalid driver function.
6	Shutdown	When the power supply is on, the condition of receiving Shutdown command. Check out the condition of the power supply is off.	Nothing special
7	Disable voltage	the condition of receiving Disable voltage instruction. the condition of receiving Quick stop instruction. When ESM status is PreOP, SafeOP, OP, the condition of migrating to Init.	Nothing special
8	Shutdown	When the power supply is on, the condition of receiving the Shutdown instruction.	Driver function is invalid
9	Disable voltage	The condition of receiving the Disable voltage command.	Driver function is invalid
10	Disable voltage	The condition of receiving the Disable voltage command. The condition of receiving the Quick stop command. When ESM status is PreOP, SafeOP, OP, the condition of migrating to Init.	Nothing special
11	Quick stop	The condition of receiving Quick stop command.	Execute Quick stop function.
12	Disable voltage	When Quick stop selected code is 1, 2, 3 and the condition of Quick stop action completion. When Quick stop code is 5, 6, 7, and the action of Quick stop is completed, the condition of receiving Disable voltage command. Check out the condition of power OFF.	Driver function is invalid.
13	Error occurs	Abnormal detection.	Execute Fault reaction function.
14	Auto skip 2	After the abnormal detection and deceleration processing is completed, it will be migrated automatically.	Driver function is invalid.
15	Fault reset	After the removal of abnormal factors, the condition of receiving the Fault reset instruction.	The fault factor does not exist, Excute the reset of the Fault state.
16	Enable operation	When Quick stop selected code is 5, 6, 7, the condition of receiving Enable operation command.	Driver function is effective.

8.4.3 Controlword (6040h)

The command to control the slave station (servo driver) such as PDS status migration is set through 6040h (control word).

Index	Sub-index	Na	me	Rang	ge	Data type	Acces	s l	PDO	Op-mode

Enable operation	0	1	1	1	1	4,16
Disable voltage	0	-	-	0	-	7,9,10,12
Quick stop	0	-	0	1	-	7,10,11
Disable operation	0	0	1	1	1	5
Fault reset	0->1	-	-	-	-	13

(1) Bit logic of quick stop command is effective under 0.

Please note that other bit logic and the opposite actions are performed.

2 Bit8 (halt): When it is 1, motor decelerating and stop are performed through 605Dh (Halt select code)

After the pause, the enable must be turned off to restart the action.

(3) Bit9, 6-4 (operation mode specific):

The following shows the change of OMS bit inherent in the control mode (OP mode). (for details, please refer to the chapter of related objects of each control mode.)

Op-mode	Bit9	Bit6	Bit5	Bit4
pp	change on set-point	absolute / relative	change set immediately	new set-point
pv	-	-	-	-
tq	-	-	-	-
hm	-	-	-	start homing

csp	-	-	-	-
csv	-	-	-	-
cst	-	-	-	-

8.4.4 Statusword (6041h)

The status confirmation o	of slave station ((servo driver)) is carried out b	y 6041h (status word).
The status commutation o	I blate blation		15 cullied out o	y oo i in (blacks work).

Index	Sub-index	Nan	Name		e	Data type	Access	Р	DO	Op-mode
6041h	00h	Status word		0~6553	35	U16	ro	Tx	PDO	All
		Indicates	the status	of the serv	vo drive	er.				
		Bit inform	nation							
		15	14	13	12	11	10	9	8	
		1	r	or	ns	ila	oms	rm	r	
		7	6	5	4	3	2	1	0	
		w sod		qs	ve	f	oe	so	rsto	
		r = reserve	ed (not co	orresponde	d)	w = wa	w = warning			
		sod = swi	sod = switch on disabled							
		oms = ope	eration m	ode specifi	c	qs = qu	iick stop			
		(control m	node is ba	used on bit)	ve = voltage enabled				
		ila = internal limit active				f = fau	lt			
		oe = opera	ation enal	oled						
		rm = remote				so = sv	witched on			
		rtso = ready to switch on								

Bit6,5,3-0 (switch on disabled/quick stop/fault/operation enabled/switched on/ready to switch on): confirm the PDS status based on this bit. The following is the relationship between status and related bit.

StatusWord	PDS State			
xxxx xxxx x0xx 0000 b	Not ready to switch on	Initialize incompleted state		
xxxx xxxx x1xx 0000 b	Switch on disabled	Initialize completed state		
xxxx xxxx x01x 0001 b	Ready to switch on	Initialize completed state		
xxxx xxxx x01x 0011 b	Switched on	Servo enable OFF/servo ready		
xxxx xxxx x01x 0111 b	Operation enabled	Servo enable ON		
xxxx xxxx x00x 0111 b	Quick stop active	Stop at once		
xxxx xxxx x0xx 1111 b	Fault reaction active	Abnormal (alarm) judgment		
xxxx xxxx x0xx 1000 b	Fault	Abnormal (alarm) state		

Bit4 (voltage enabled) = 1: power supply is ON PDS.

Bit5 (quick stop) = 0: PDS receives quick stop request. The bit logic of quick stop is effective under 0. Please note that other bit logic and the opposite actions are performed.

Bit7 (warning) = 1, warning occurs. When warning, PDS status will not change and motor will continue to operate.

Bit9 (remote) = 0(local), the status that 6040(Controlword) cannot operate.

Bit9 =1(remote), the status that 6040(Controlword) can operate. The ESM state changes to 1 when the state transforms above PreOP.

Below bit13,12,10 (operation mode specific): change of OMS bit inherent in control mode. (for details, please

refer to the chapter of related objects of each control mode.)

Op-mode	Bit13	Bit12	Bit10
pp	following error	set-point acknowledge	target reached
pv	-	speed	target reached
tq	-	-	target reached
hm	homing error	homing attained	target reached
csp	following error	drive follows command value	-
csv	-	drive follows command value	-
cst	-	drive follows command value	-

Bit11(internal limit active): the main reason for the internal limit is that the bit11 (internal limit active) of 6041h (status word) changes to 1.

Bit15,14(reserved): This bit is not used (fixed 0).

8.5 Control mode setting

8.5.1 Supported drive modes (6502h)

Index	Sub-index		m the supp me / Descri			Range	on de		ta type	Acces	·	PDO	Op-mode
6502h	00h		orted drive	-	0.	~42949672	205		U32	ro		TxPDO	All

			0				0			1		1	
		7	6	5		4	3		2	1		0	
		cs	p r	hn	1	r	to	1	pv	r		pp	
		1	0	1		0	1		1	0		1	
		Bit			M	ode of ope	ratio	n			Abb	or. Corr	esponding
		0	Profile po	sition mo	ode	(Profile po	osition	n con	ntrol mod	e)	pp	,	YES
		2	Profile ve	locity mo	ode(Profile spo	eed co	ontro	l mode)		pv	r	YES
		3	Torque pr	ofile mo	de(F	Profile torc	ue co	ontro	l mode)		tq		YES
		5	Homing r	node(orig	gin r	eset positi	on m	ode)			hm	1	YES
		7	Cyclic sy	nchronou	ls po	osition mo	de(Cy	yclic	position	control	csp	,	YES
			mode)						-				
		8	8 Cyclic synchronous velocity mode(Cyclic speed control					csv	7	YES			
			mode)										
		9	,	nchronou	is to	orque mo	le (C	velic	torque	control	cst	t	YES
			mode)		-	1	(-	5	1 -	_			

This servo driver can confirm the supported modes of operation according to 6502h (supported drive modes).

8.5.2 Modes of operation(6060h)

Set the control mode through 6060h (Modes of operation).

Index	Sub-index	Name/D	escription	Range	DateType	Access	PD	0	Op-mode
6060h	00h	Mode of	operation	-128~127	18	rw	RxP	DO	All
		Set the con	Set the control mode of servo driver.						
		Non corres	on corresponding control mode setting is inhibited.						
		bit Mode of operation				Abbr.	Corr	responding	
		-128~	Reserved				-		-
		-1							
		0	0 No mode changed/No mode assigned				-		-
			(no contro	ol mode c	changed/no d	control mode			
			distribution)					

1	Profile position mode (Profile position control mode)	pp	YES
3	Profile velocity mode (Profile speed control mode)	pv	YES
4	Torque profile mode (Profile torque control mode)	tq	YES
6	Homing mode (origin reset position mode)	hm	YES
8	Cyclic synchronous position mode (Cyclic position control mode)	csp	YES
9	Cyclic synchronous velocity mode (Cyclic speed control mode)	csv	YES
10	Cyclic synchronous torque mode(Cyclic torque control mode)	cst	YES
11~127	Reserved	-	-

Because 6060h (modes of operation) is default = (no mode change / no mode assigned), please set the control mode value to be used after the power is put into operation. When the set value of 6060h is 0 and the set value of 6061h is 0, if the PDS state is migrated to Operation enabled, E-881 (control mode setting fault protection) occurs. After the initial state of 6060h = 0 (no mode assigned) is transferred to the supported control mode (PP, PV, TQ, HM, CSP, CSV, CST), set 6060h = 0 is seemed as "no mode changed", and the control mode can not be switched. (keep the previous control mode).

8.5.3 Modes of operation display(6061h)

The confirmation of the control mode inside the servo driver is performed according to 6061h (modes of operation display). After 6060h (modes of operation) is set, please confirm whether it is feasible to set this object action through detection.

Index	Sub-index	Nam	e/Description	Range	DateType	Access	s 1	PDO	Op-mode

9 Servo gain adjustment

9.1 Overview of servo gain adjustment

9.1.1 Overview and process

Linear servo drives require high precision and high response to drive linear motors, in order to track instructions from the upper computer or internal settings. To meet this requirement, it is necessary to adjust the servo gain reasonably. Due to the special nature of linear motors, motor settings must be made before adjusting the gain, otherwise the linear motor cannot be controlled normally. The motor setting steps are detailed in Appendix 4 Motor Settings.

Servo gain factory value is adaptive mode, but different machines have different requirements for servo responsiveness; the following figure is the basic process of gain adjustment, please adjust according to the current machine status and operation conditions.

9.1.2 Differences between these adjustment modes

Adjustment modes are divided into adaptive and auto-tuning, and their control algorithms and parameters are independent. Among them, the auto-tuning mode is divided into three functions: fast adjustment, automatic adjustment and manual adjustment. The three functions are the same in essence but different in implementation. Refer to the corresponding chapters of each function.

Mode	Туре	Parameters	Rigidity	Responsiveness	Related parameters
Adaptive	Automatic adaptation	P2-01.0=1	Middle	150ms	 P2-05 adaptive speed loop gain P2-10 adaptive speed loop integral P2-11 adaptive position loop gain P2-07 adaptive inertia ratio P2-08 adaptive speed observer gain P2-12 adaptive stable max inertia ratio

Auto-tuning	Fast adjustment	P2-01.0=0	High	$10 \sim 50 \text{ms}$	P0-07 First inertia ratio P1-00 Speed loop gain
	Automatic adjustment		High 10ms		P1-01 Speed loop integral P1-02 Position loop gain
	Manual adjusting		High	Determined by	P2-35 Torque instruction filtering time constant 1 P2-49 Model loop gain

9.2 Rotary inertia presumption

9.2.1 Overview

Rotational inertia estimation is the function of automatic operation (forward and reverse) in the driver and estimate the load inertia in operation.

Rotational inertia ratio (the ratio of load inertia to motor rotor inertia) is a benchmark parameter for gain adjustment, and it must be set to the correct value as far as possible.

Parameter	Meaning	Default setting	Unit	Setting range	Modification	Effective
P0-07	First inertia ratio	500	%	0~50000	anytime	At once

9.2.2 Notes

Occasions where inertia cannot be presumed

• Mechanical systems can only operate in one direction

The occasion where inertia presumption is easy to fail

- Excessive load moment of inertia
- The running range is narrow and the travel is within one polar distance.
- The moment of inertia varies greatly during operation.
- Mechanical rigidity is low and vibration occurs when inertia is presumed.

Notes of inertia presumption

- Since both directions are rotatable within the set range of movement, please confirm the range or direction of movement; and ensure that the load runs in a safe journey.
- If the presumed inertia under default parameters runs jitter, indicating that the present load inertia is too large. It is also possible to set the initial inertia to about twice the current one and execute again under larger loads.
- Driver inertia ratio recognition upper limit is 500 times (parameter upper limit is 20000). If the estimated inertia ratio is exactly 20000, it means that the inertia ratio has reached the upper limit and can not be used, please replace the motor with larger rotor inertia.

Other notes

- At present, the inertia switching function is not supported, and the second inertia ratio is invalid.
- The inertia ratio upper limit changes to 500 times (parameter upper limit value is 50000).

9.2.3 Operation tool

Operation tool	Description				
Driver panel	Driver firmware needs version 4600				
XinjeServo software	Linear drive upper computer software				

The presumptive tools of load moment of inertia are driver panel and XinjeServo software.

Note: driver firmware version can be checked through U2-07.

9.2.4 Operation steps

Estimate the inertia through the driver panel

1. Parameter setting

Parameter	Setting	Default setting	Unit	Range	Modification	Effective
P2-15	Inertia configured trip	100	0.01 polar distance (N-N)	1~300	Anytime	At once
P2-17	Inertia identification and internal instruction auto-tuning max speed	0	mm/s	0~65535	Anytime	At once
P2-18	Inertia identification initial inertia ratio	500	%	1~20000	Anytime	At once

The recommended parameters of P2-17 are 500mm/s or more. Low instruction speed will lead to inaccurate identification of inertia ratio. The default is 1/3 of the rated speed, this parameter will be calculated based on the rated speed in the motor parameters.

2. Execute the inertia identification

Before inertia identification, please confirm the direction of servo rotation by using F1-00 jog motion function. Initial direction of servo operation is determined by INC or DEC at the beginning of inertia identification. Servo entering parameter F0-07 in BB state:

í.	-			
		_	_	
1 I				
<u> </u>				
\sim		_		

Press ENTER, servo is enabled:

í i		1		
I	<u> </u>	<u> </u>	_	_
1				
ر		'		,

Press INC or DEC to run forward or reverse (select one of them):

At this point, start action, under the condition of P0-05 = 0 (initial positive direction), if press INC, then turn forward and then reverse; if press DEC, turn reverse and then forward. If the inertia identification is successful, the load inertia ratio is prompted and written to P0-07 automatically after several forward and reverse operations. If the inertia identification error occurs, the error code will be displayed. Press STA/ESC key to exit the panel inertia identification operation.

Error code	Meaning	Reasons and solutions	Reasons
Err-1	Motor torque saturation	 Initial inertia is too small; in adaptive mode, switch to large inertia mode P2-03.3=1 or the initial inertia of inertia identification P2-18 set to 2 times of the present value. The maximum speed is too high (P2-17), but it is recommended not to be less than 500mm/s. Low instruction speed will lead to inaccurate identification of inertia ratio. Torque limit too small (P3-28/29) 	Initial inertia too small; Maximum speed too large; Torque limit too small
Err-2	Value error is too large when calculating the inertia	 The maximum speed limit is too small (P2-17), but it is recommended not to be less than 500mm/s. Low instruction speed will lead to inaccurate identification of inertia ratio. The presumed inertia trip is too small. It is suggested that the minimum for P2-15 should no be less one polar distance, if the trip is too small, the identification of inertia ratio will be inaccurate. mechanism friction too large overshoot 	The maximum speed limit is too small; the travel is too small; the friction of the mechanism is too large; the overrun occurs
Err-3	Driver internal trip calculation error	(1) The presumed inertia trip is too small. It is suggested that the minimum for P2-15 should no be less than one polar distance. If the trip is too small, the identification of inertia ratio will be inaccurate.	Contact us
Err-5	Unrestrained Vibration in the Process of Inertia Identification	Unhandled vibration occurs	Unhandled vibration occurs
Err-6	Driver is not currently in BB state	 Enable have been opened. P5-20 can be set to 0 first When the driver alarms, it will appear. Press ESC key to exit the auto-tuning interface to see if there is an alarm. 	Will occur when enable is turned on or driver has alarm
Err-7	The driver alarms in the process of inertia identification	Driver has alarm, press ESC key to exit the auto-tuning interface, check the alarm code, first solve the alarm and then make inertia estimation.	Driver has alarm

• Alarm for inertia identification of panel

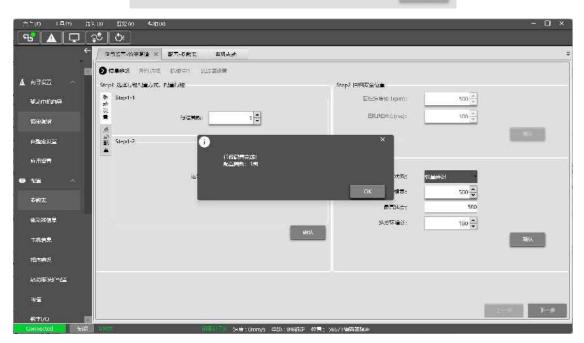

Estimate the inertia through XinJeServo

(1) Click on [Inertia Recognition] on the main menu screen of XinJeServo, or enter [Simple Tuning] after completing the drive motor guide.

- If the self-tuning interface is directly closed at this time, the driver will only be configured with the inertia ratio parameter.
- The detailed steps for using XinJeServo to estimate inertia can be found in XinJeServo's help documentation.

9.3 Fast adjustment

9.3.1 Overview

Fast adjustment needs to set the moment of inertia of load first. If the inertia does not match, it will cause oscillation alarm. Fast adjustment of gain parameters belongs to auto-tuning mode.

9.3.2 Fast adjustment steps

1. Estimate the load inertia through servo driver panel or XinJeServo software, refer to chapter 9.2 Rotary inertia presumption.

2. Set the rigidity level P0-04

Note: P2-01.0 is the first bit of P2-01

9.3.3 Rigidity level corresponding gain parameters

The rigidity level should be set according to the actual load. The larger the P0-04 value, the greater the servo gain. If there is vibration in the process of increasing the rigidity level, it is not suitable to continue to increase. If vibration suppression is used to eliminate vibration, it can try to continue to increase. The following is the recommended rigidity level of the load for reference.

Supports three types of rigidity levels, selected through P6-00.0:

(1) P6-00.0=0: Standard mode [default]

Rigid level P0-04, associated with 4 parameters, P1-00, P1-01, P1-02, P2-35;

(2) P6-00.0=1: Positioning mode, also known as soft mode

By balancing responsiveness and using gain switching, the overshoot at the end of positioning is minimized, with a rigidity level of P0-04 and associated with 7 parameters, P1-00, P1-01, P1-02, P2-35, P1-05, P1-06, P1-07. Bind to force gain switching, P1-14=0x00A1;

(3) P6-00.0=2: Quick positioning mode

Enable model loop and disturbance observer Dob, rigidity level P0-04, associate 5 parameters, P1-00, P1-01, P1-02, P2-35, P2-49. Forcefully bind P2-00.0 and P2-41 of the disturbance observer Dob, as well as P2-47.0 and P2-49 of the model loop.

9.3.4 Notes

- In the fast adjustment mode, the gain parameters corresponding to the rigidity level can be independently fine tuned.
- The quick adjustment mode will be configured with a rigid level by default. If the gain does not meet the mechanical requirements, please gradually increase or decrease the setting.
- To ensure stability, the model loop gain is given relatively small at low rigidity levels. When there are high response requirements, this parameter value can be increased separately.
- When vibration occurs during rapid adjustment, the torque command filter P2-35 can be modified. If there is no effect, mechanical characteristic analysis can be used to set relevant notch parameters (refer to 9.7 Vibration Suppression).

9.4 Auto-tuning

9.4.1 Overview

Auto-tuning is divided into internal instruction auto-tuning and external instruction auto-tuning.

Auto-tuning (internal instruction) refers to the function of automatic operation (forward and reverse reciprocating motion) of servo unit without instructions from the upper device and adjusting according to the mechanical characteristics in operation.

Auto-tuning (external instruction) is the function of automatically optimizing the operation according to the instructions from the upper device.

The automatic adjustments are as follows:

- Load moment of inertia
- Gain parameters (speed loop, position loop, model loop gain)
- Filter (notch filter, torque instruction filter)

9.4.2 Notes

Untunable occasions

• Mechanical systems can only operate in one direction.

Setting the occasion prone to failure

- Excessive load moment of inertia
- The moment of inertia varies greatly during operation.
- Low mechanical rigidity, vibration during operation and failure of detection positioning.
- The running distance is less one polar distance.

Preparations before auto-tuning

- Use position mode;
- Driver in bb status;
- Driver without alarm;
- The matching of the number of pulses per rotation and the width of positioning completion should be reasonable.

9.4.3 Operation tools

Internal instruction auto-tuning and external instruction auto-tuning can be executed by driver panel and XinJeServo software.

Auto-tuning mode	Operation tools	Limit item	
Internal instruction	XinJeServo software	Linear servo drive upper computer	
auto-tuning		software	
external instruction	Duiven non al	Driver firmware needs 4600 and higher	
auto-tuning	Driver panel	versions	

Note: please check the driver firmware version through U2-07.

9.4.4 Internal instruction auto-tuning steps

Driver panel auto-tuning steps

- 1. The inertia identification is carried out, and the inertia estimation steps please refer to chapter 9.2.4.
- 2. Enter F0-09, panel display iat-;

3. Press ENTER, panel display iat--; servo is in enabled status right now;

4. Press INC or DEC, panel display is tune and flashing, enter auto-tuning status.

5. Driver will automatically send pulse instructions, if the auto-tuning is successful, the panel shows done and flashing.

6. Press STA/ESC to exit internal instruction auto-tuning.

Note: In the process of auto-tuning, press STA/ESC will exit the auto-tuning operation and use the gain parameters at the exit time. If auto-tuning fails, it is necessary to initialize the driver before auto-tuning again.

Panel alarm in auto-tuning process

Note: P2-60~P2-63 are automatically modified in auto-tuning process. Users are not allowed to modify them manually. Manual modification may lead to the risk of system runaway.

9.5 Manual adjustment

9.5.1 Overview

Position control loop diagram (turn on the model loop)

Servo unit consists of three feedback loops (current loop, speed loop and position loop) from inside to outside. The more inner loop, the more responsive it is. Failure to comply with this principle will result in poor response or vibration. Among them, the current loop parameters are fixed values to ensure adequate responsiveness, and users do not need to adjust.

Please use manual adjustment in the following occasions:

- When the expected effect can not be achieved by fast adjusting the gain
- When the expected effect is not achieved by automatically adjusting the gain

9.5.2 Adjustment steps

In position mode, if the soft mode (P2-02.0=1) is selected by auto-tuning, the function of model loop will be turned off; in speed mode, the gain of position loop will be invalid.

Increasing response time

- 1. Reducing the filter time constant of torque instruction (P2-35)
- 2. Increasing Speed Loop Gain (P1-00)
- 3. Reducing Integral Time Parameter of Speed Loop (P1-01)
- 4. Increasing the gain of position loop (P1-02)
- 5. Improving Model Loop Gain (P2-49)

Reduce response, prevent vibration and overshoot

- 1. Reduce the Speed Loop Gain (P1-00)
- 2. Increase Integral Time Constant of Speed Loop (P1-01)
- 3. Reduce the gain of position loop (P1-02)
- 4. Increase the filter time constant of the torque instruction (P2-35)
- 5. Reduce Model Loop Gain (P2-49)

9.5.3 Gain parameter for adjustment

The gain parameters that need to be adjusted:

- P1-00 Speed loop gain
- P1-01 Integral Time Constant of Speed Loop
- P1-02 Position loop gain
- P2-35 Torque instruction filter time constant
- P2-49 Model loop gain

• Speed loop gain

Because the response of the speed loop is low, it will become the delay factor of the outer position loop, so overshoot or vibration of the speed command will occur. Therefore, in the range of no vibration of mechanical system, the larger the setting value, the more stable the servo system and the better the responsiveness.

Parame ter	Name	Default setting	Unit	Range	Modificat ion	Effective
P1-00	Speed loop gain	<=20P7: 300 >=21P0: 180	0.1Hz	10~20000	Anytime	At once

• Speed loop integration time constant

In order to respond to small inputs, the speed loop contains integral elements. Because this integral element is a delay element for the servo system, when the time constant is set too large, overshoot will occur, or the positioning time will be prolonged, resulting in poor responsiveness.

The gain of the speed loop and the integral time constant of the speed loop roughly meet the following relationship: $P1-00 \times P1-01 = 636620$.

Parame ter	Name	Default setting	Unit	Range	Modify	Effective
P1-01	Speed loop integration time constant	<=20P7: 2653 >=21P0: 4421	0.01ms	15~51200	Anytime	At once

• Position loop gain

When the model loop is invalid (P2-47.0=0), the responsiveness of the position loop of the servo unit is determined by the gain of the position loop. The higher the position loop gain is, the higher the responsiveness is and the shorter the positioning time is. Generally speaking, the gain of position loop cannot be increased beyond the natural vibration number of mechanical system. Therefore, in order to set the position loop gain to a larger value, it is necessary to improve the rigidity of the machine and increase the number of inherent vibration of the machine.

Parameter	Meaning	Default setting	Unit	Range	Modify	Effective
P1-02	Position loop gain	<=20P7: 480 >=21P0: 288	0.1/s	10~20000	Anytime	At once
		>=21P0: 288				

• Torque command filtering time constant

When machine vibration may be caused by servo drive, it is possible to eliminate vibration by adjusting the filtering time parameters of the following torque instructions. The smaller the numerical value, the better the response control can be, but it is restricted by the machine conditions. When vibration occurs, the parameter is generally reduced, and the adjustment range is suggested to be 10-150.

Parameter	Name	Default setting	Unit	Range	Modify	Effective
P2-35	Torque command filtering time constant	66	0.01ms	0~65535	Anytime	At once

• Model loop gain

When the model loop is valid (P2-47.0=1), the response of the servo system is determined by the gain of the model loop. If the gain of the model loop is increased, the responsiveness is increased and the positioning time is shortened. At this time, the response of the servo system depends on this parameter, not P1-02 (position loop gain). The gain of the model loop is only valid in position mode.

Parameter	Meaning	Default setting	Unit	Range	Modify	Effective
P2-49	Model loop gain	480	0.1Hz	10~20000	Anytime	At once

9.6 Adaptive

9.6.1 Overview

Adaptive function means that no matter what kind of machine and load fluctuation, it can obtain stable response through automatic adjustment. It starts to automatically adjust when servo is ON.

9.6.2 Notes

- When the servo unit is installed on the machine, it may produce instantaneous sound when the servo is ON. This is the sound when the automatic notch filter is set, not the fault. For the next time the servo is ON, no sound will be emitted.
- When the inertia of the motor exceeds the allowable load, the motor may produce vibration. At this time, please modify the adaptive parameters to match the present load inertia.
- In adaptive operation, in order to ensure safety, the adaptive function should be executed at any time when the servo enablement can be stopped or turned off urgently.

9.6.3 Operation steps

The factory settings are self-adaptive effective without modifying other parameters. The effectiveness of self-adaptation is controlled by the following parameters.

Par	ameter	Meaning	Default setting	Modify	Effective
P2-01	$n.\Box\Box\Box0$	Adaptive shutdown	n1	Servo bb	Re-power
r2-01	n.□□□1	Adaptive open	n.□□□l	30100 00	on

9.6.4 Inertia mode and related parameters

The adaptive default parameter is defined as small inertia mode. If the load inertia far exceeds the allowable load inertia of the motor (such as 60 times inertia of the 60 motor), the adaptive large inertia mode can be turned on.

Par	rameter	Meaning	Default setting	Modify	Effective
D2 02	n.0□□□	Adaptive small inertia mode		Course hh	De neuven en
P2-03	n.1000	Adaptive large inertia mode	n.0□□□	Servo bb	Re-power on

Parameter Meaning	Default	Modify	Effective
-------------------	---------	--------	-----------

		setting		
P2-05	Adaptive speed loop gain	400	Servo bb	Re-power on
P2-10	Adaptive speed loop integral	500	Servo bb	Re-power on
P2-11	Adaptive position loop gain	100	Servo bb	Re-power on
P2-07	Adaptive inertia ratio	0	Servo bb	Re-power on
P2-08	Adaptive speed observer gain	60	Servo bb	Re-power on
P2-12	Adaptive stable max inertia ratio	30	Servo bb	Re-power on
P2-16	Adaptive motor rotor inertia coefficient	100	Servo bb	Re-power on
P2-19	Adaptive bandwidth	50	Anytime	At once
P6-05	Adaptive large inertia mode speed loop gain	200	Servo bb	Re-power on
P6-07	Adaptive large inertia mode inertia ratio	50	Servo bb	Re-power on
P6-08	Adaptive large inertia mode speed observer gain	40	Servo bb	Re-power on
P6-12	Adaptive large inertia mode max inertia ratio	50	Servo bb	Re-power on

9.6.5 Adaptive parameter effect

Parameter small /large inertia	Name	Default value	Range	Effect
P2-05/P6-05	Adaptive speed loop gain	400/200	200~400	Decreasing can improve the inertia capacity, but will reduce the responsiveness, which has a great impact on the responsiveness
P2-07/P6-07	Adaptive load inertia ratio	0/50	0~200	Increase can greatly improve the inertia capacity, and will not affect the responsiveness. Too large will cause oscillation
P2-08/P6-08	Speed observer gain	60/40	30~60	Decreasing P2-08 and increasing P2-12 can greatly improve the inertia capability,
P2-12/P6-12	Adaptive stable max inertia ratio	30/50	30~60	but will reduce the responsiveness, which has a great impact on the responsiveness
P2-10	Adaptive speed loop integral time coefficient	500	200~larger	Adjust according to need, generally increase
P2-11	Adaptive position loop gain coefficient	100	50~200	Adjust according to the need, increasing will make the response fast, reducing will make the response slow
P2-16	Adaptive motor rotor inertia coefficient	100	100~200	Increasing can improve the servo rigidity, enhance the anti-interference ability, and solve the running jitter
P2-19	Adaptive bandwidth	50~70	40~80	Increasing will slightly improve the inertia capacity of the belt, which has little

		impact on the responsiveness, as an
		auxiliary parameter

9.6.6 Invalid parameters when adaptive effective

When the adaptive function is effective (P2-01.0=1), the invalid parameters are shown as below:

Item	Parameters	Name
	P1-00	First speed loop gain
	P1-05	Second speed loop gain
	P1-01	First speed loop integral time constant
	P1-06	Second speed loop integral time constant
	P1-02	First position loop gain
Gain	P1-07	Second position loop gain
	P2-49	Model loop gain
	P0-07	First inertia ratio
	P0-08	Second inertia ratio
	P5-36	/I-SEL inertia ratio switch

9.7 Vibration suppression

9.7.1 Overview

The mechanical system has a certain resonance frequency. When the servo gain is increased, the continuous vibration may occur near the resonance frequency of the mechanical system. Generally in the range of 400Hz to 1000Hz, it caused the gain can not continue to increase. Vibration can be eliminated by automatically detecting or manually setting the vibration frequency. After the vibration is eliminated, if the responsiveness needs to be improved, the gain can be further improved.

Note:

(1) Servo responsiveness will change after vibration suppression operation.

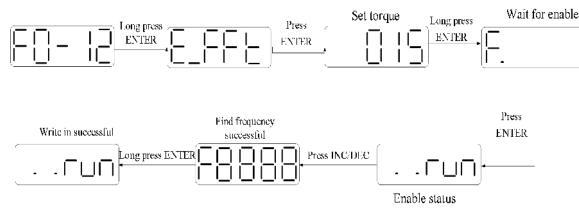

(2) Please set the inertia ratio and gain parameters correctly before performing the vibration suppression operation, otherwise it can not be controlled properly.

9.7.2 Operation tools

Adjustment mode	Operation tools	Control mode	Operation steps	Limitation
Adaptive mode	XinJeServo Mechanical Characteristic Analysis		9.7.4Vibration Suppression (PC Software)	All software versions support
Auto-tuning	Panel vibration suppression	Position	9.7.3 Vibration Suppression (fast FFT)	None
mode	XinJeServo Mechanical Characteristic Analysis	mode	9.7.4 Vibration Suppression (PC Software)	All software versions support
Auto-tuning /adaptive mode	Panel vibration suppression		9.7.3 Vibration suppression (fast FFT)	None

9.7.3 Vibration suppression (fast FFT)

The function can analyze the mechanical characteristics through the parameter F0-12 on the servo operate panel, find out the mechanical resonance frequency and realize the vibration suppression. The complete operation process is shown in the figure below:

The operation steps are described as follows:

1. F0-12, long press [ENTER] to enter quick FFT function, it will show "E FFt".

2. Press **[ENT]** to enter torque setting interface, it will show the current setting torque, which is the value of P6-89. Press **[\land]**, **[\checkmark]** to increase or decrease torque command. When increasing the torque command, it is recommended to increase it a little bit to avoid severe vibration of the equipment.

3. After setting the torque command, long press [ENT], enter "read to enable" status, it will show 'F".

4. Press [ENT], enable, it will show "..run".

5. Press $[\land], [\lor]$ to run forward or reverse and find the resonance frequency. "E_FFt" will shining on the panel when operation. If the resonance frequency is found, it will show "Fxxxx", "xxxx" is the resonance frequency. If failed, it will show "F----".

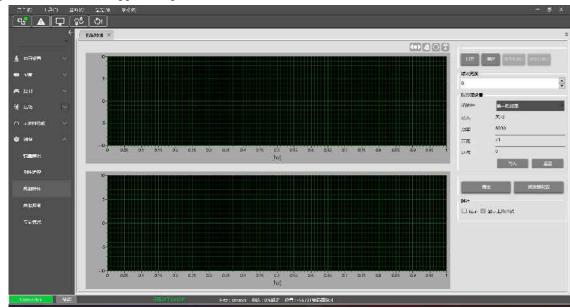

roooo	Í 🗖				Ē
	[i—	i⊒i	Ū	ίΞ	Ū

6. Whatever it shown "Fxxxx" or "F----", press $[\land]$, $[\lor]$ can find the resonance frequency again. If the resonance frequency is found, long press [EN] to set the resonance frequency in the notch filter of servo driver.

|--|

Note: for above each step, press STA/ESC can return to the last step, press STA to exit.

9.7.4 Vibration suppression (software)

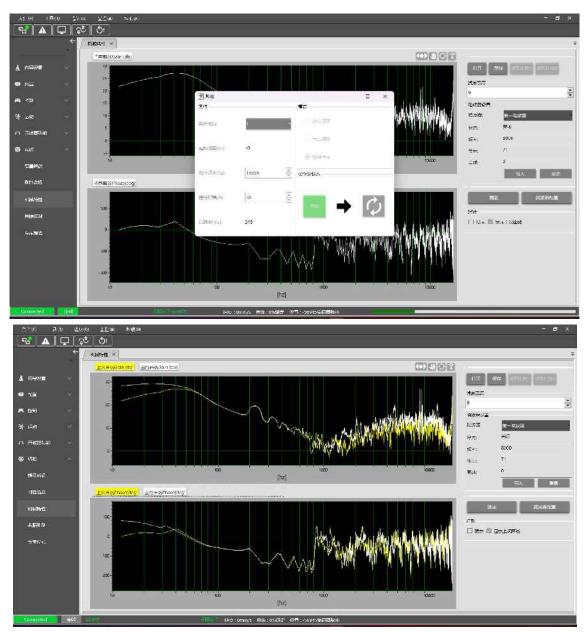

(1) Open the XinJeServo upper computer software and select mechanical characteristics.

(2) Click [measure].

In both adaptive and auto-tuning modes, if mechanical characteristic analysis is used, the notch can be set manually. If there are multiple resonance points, the third to fifth notch can be configured in turn.

9.7.5 Vibration suppression(manual setting)

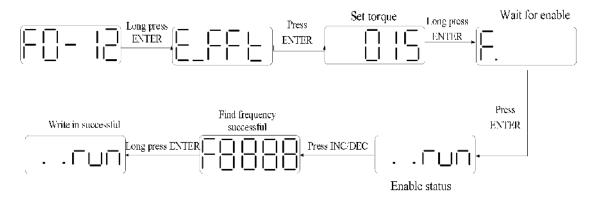

(i

If the resonance frequency of the mechanical system is known, the vibration can be eliminated by setting the vibration frequency manually. Please configure the third to fifth notches. The related parameters are detailed in 9.7.6 notch filter.

9.7.6 Vibration suppression (easy FFT)

This function can analyze the mechanical characteristics through the parameter F0-12 on the servo operate panel, find out the mechanical resonance frequency and realize the vibration suppression.

The complete operation process is shown in the figure below:

The operation steps are described as follows:

1. F0-12, long press [ENTER] to enter EasyFFT function, it will show "E FFt".

2. Press **[**ENTER**]** to enter torque setting interface, it will show the current setting torque, which is the value of P6-89. Press **[**INC**]**, **[**DEC**]** to increase or decrease torque instruction. When increasing the torque instruction, it is recommended to increase it a little bit to avoid severe vibration of the equipment.

3. After setting the torque instruction, long press [ENTER], enter "read to enable" status, it will show 'F".

4. Press [ENTER], enable, it will show "..run".

5. Press [INC], [DEC] to run forward or reverse and find the resonance frequency. "E_FFt" will shining on the panel when operation. If the resonance frequency is found, it will show "Fxxxx", "xxxx" is the resonance frequency. If failed, it will show "F----".

Í.		U

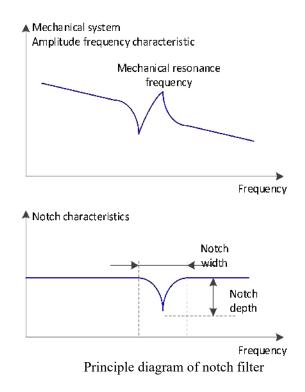

6. Whatever it shown "Fxxxx" or "F----", press [INC], [DEC] can find the resonance frequency again. If the resonance frequency is found, long press [ENTER] to set the resonance frequency in the notch filter of servo driver.

		10-220	1 - 200 <u>-</u> 2	
		-1	- HC	۰.
-	-			

Note: for above each step, short press STA/ESC can return to the last step or exit.

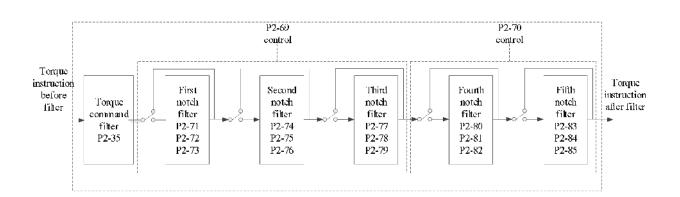

9.7.7 Notch filter

Notch filter can suppress mechanical resonance by reducing the gain at a specific frequency. After the notch filter is set correctly, the vibration can be effectively suppressed and the servo gain can be continuously increased. The principle diagram of notch filter is as follows:

The servo driver has five sets of notch filters, each with three parameters, notch frequency, notch attenuation and notch bandwidth. The first and second notches are set automatically, and the third, fourth and fifth are set manually.

The torque instruction filter and notch filter are in series in the system. As shown in the figure below, the switch of the notch filter is controlled by P2-69 and P2-70.

Para	meter	Meaning	Default setting	Modify	Effective
	$n.\square\square\square0$	First notch off	n.□□□0	Anytimo	At once
	n.□□□1	First notch on		Anytime	At once
P2-69	n.□□0□	Second notch off			A.t. a.m.a.a.
P2-09	n.==1=	Second notch on	n.□□0□	Anytime	At once
	n.0□□□	Third notch off	n.0	Anytime	At once
	n.1000	Third notch on		Anytime	At once
	n.□□□0	Fourth notch off			A.t. a.m.a.a.
P2-70	n.□□□1	Fourth notch on	n.□□□0	Anytime	At once
r2-70	n.□□0□	Fifth notch off	n.□□0□	Anytimo	At once
	n.□□1□	Fifth notch on		Anytime	At once

Parameter	Meaning	Default setting	Unit	Range	Modify	Effective
P2-71	First notch frequency	8000	Hz	$50 \sim 8000$	Anytime	At once
P2-72	First notch attenuation	71	0.01dB	50~1600	Anytime	At once
P2-73	First notch bandwidth	0	0.001Hz	0~1000	Anytime	At once
P2-74	Second notch frequency	8000	Hz	$50 \sim 8000$	Anytime	At once
P2-75	Second notch attenuation	71	0.01dB	50~1600	Anytime	At once
P2-76	Second notch bandwidth	0	0.001Hz	0~1000	Anytime	At once
P2-77	Third notch frequency	8000	Hz	50~8000	Anytime	At once
P2-78	Third notch attenuation	71	0.01dB	50~1600	Anytime	At once
P2-79	Third notch bandwidth	0	0.001Hz	0~1000	Anytime	At once
P2-80	Fourth notch frequency	8000	Hz	50~8000	Anytime	At once
P2-81	Fourth notch attenuation	71	0.01dB	50~1600	Anytime	At once
P2-82	Fourth notch bandwidth	0	0.001Hz	0~1000	Anytime	At once
P2-83	Fifth notch frequency	8000	Hz	$50 \sim 8000$	Anytime	At once
P2-84	Fifth notch attenuation	71	0.01dB	50~1600	Anytime	At once
P2-85	Fifth notch bandwidth	0	0.001Hz	0~1000	Anytime	At once

- In the adaptive mode, if the vibration is detected, the second notch filter will be automatically configured.
- In the auto-tuning mode, the second and first notches will be automatically configured if the vibration is detected (the second notches will be preferentially opened when there is only one vibration point).
- Whether in self-adaptive or auto-tuning mode, if the mechanical characteristic analysis is sued, it belongs to manual setting of notches, please configure the third to fifth notches.

9.8 Gain adjustment application

9.8.1 Model loop control

In the self-tuning mode, in addition to the gain of speed loop and position loop, there is also the gain of model loop, which has a great influence on the servo response. When the model loop is not open, the servo responsiveness is determined by the position loop gain. When the model ring is open, the servo responsiveness is determined by the model loop gain. The model loop is equivalent to the feedforward function in the driver control loop.

When the self-tuning mode is soft, the model loop function will be automatically off. When the self-tuning mode selects fast positioning or fast positioning (control overshoot), the model loop function will be automatically turned on.

Self-tuning mode

	Par	ameter	Meaning	Defult setting	Modify	Effective
		n.□□□1	Soft			
	P2-02	n.□□□2	Fast positioning	n?	Anytime	Atomaa
			Quick positioning (control	n.□□□3 Anytime		At once
		n.□□□3	overshoot)			

Selection of self-tuning mode:

(1) Soft(P2-02.0=1)

This mode does not turn on the gain of the model loop, and the operation is soft. It is suitable for occasions with insufficient mechanical rigidity and low response requirements.

(2) Quick positioning (P2-02.0 = 2)

This method has the fastest response to setting parameters, but has no special suppression on overshoot. (3) Quick positioning (control overshoot) (P2-02.0 = 3):

In this way, the setting parameter response is fast, which will inhibit the overshoot.

Load type	Explanation		
Synchronous	The adjustment is suitable for the mechanism with lower rigidity such as		
belt	synchronous belt mechanism.		
Lead screw	It is suitable for the adjustment of high rigidity mechanism such as ball screw		
Lead screw	mechanism. Please select this type when there is no corresponding structure.		
Rigid	The adjustment is suitable for rigid body system and other mechanisms with high		
connection	rigidity.		

Self-tuning	Explanation
mode	
Soft	Soft gain adjustment. In addition to gain adjustment, the notch filter is also adjusted
5011	Automatically.
Fast	Make special adjustment for positioning purpose. In addition to gain adjustment, the
positioning	model loop gain and notch filter are also adjusted automatically

Fast	Pay attention to the adjustment of no overshoot in the positioning purpose. In
positioning	addition to gain adjustment, the model loop gain and notch filter are also adjusted
(control	automatically.
overshoot)	

Par	ameter	Meaning	Default setting	Modify	Effective
	n.□□□1	Soft			
P2-02	n.□□□2	Fast positioning	n.□□□3	Anytime	At once
	n.□□□3	Fast positioning(control overshoot)			

Model loop function

Par	ameter	Meaning	Default setting	Modify	Effective
P2-47	$n.\square\square\square$	Model loop turn off		Austino	Atomaa
P2-47	n.□□□1	Model loop turn on	$n.\square\square\square$	Anytime	At once

Taking the DL6 series servo self-tuning mode and using a 400w servo with 5 times the load inertia as an example:

Model loop function turns off (soft mode)	TT: 1
Low rigidity and low response	High rigidity and medium response
Speed feedback Speed instruction	
Load inertia ra	tio P0-07:500%
Speed loop gain P1-00:200	Speed loop gain P1-00:800
Speed loop integral P1-01:3300	Speed loop integral P1-01:825
Position loop gain P1-02:200	Position loop gain P1-02:700
Phenomenon: Running jitter, slow response	Phenomenon: smooth operation and fast response

• Model loop function turns on (fast positioning or fast position(control overshoot))

Low rigidity and low response	High rigidity and low response	High rigidity and high response
Speed fixedback Speed instruction		
	Load inertia ratio P0-07:500%	
Speed loop gain P1-00:200	Speed loop gain P1-00:800	Speed loop gain P1-00:800
Speed loop integral P1-01:3300	Speed loop integral P1-01:825	Speed loop integral P1-01:825
Position loop gain P1-02:200	Position loop gain P1-02:700	Position loop gain P1-02:700
Model loop gain P2-49:300	Model loop gain P2-49:300	Model loop gain P2-49:4000

Phenomenon:	Running	jitter,	Phenomenon: smooth operation	Phenomenon: smooth operation
slow response			and slow response	And fast response

Note: The above curves only show the effect of the parameters, not the real running curves.

9.8.2 Torque disturbance observation

Disturbance observer can reduce the influence of external disturbance on servo system and improve the anti-disturbance ability by detecting and estimating the external disturbance torque of the system and compensating the torque command.

If the soft mode is selected in the auto-tuning mode, the disturbance observer will be closed automatically, and the gain of the disturbance observer will not change. If the fast positioning or fast positioning (control overshoot) is selected, the disturbance observer will be opened automatically, and the gain of the disturbance observer will be modified to 85. The relevant parameters of this function no need to be set manually by users.

Parameter Meaning		Default setting	Modify	Effective	
P2-00	$n.\square\square\square$	Turn off disturbance observer		Course hh	A t a t a a
P2-00	n.□□□1	Turn on disturbance observer	n.□□□0	Servo bb	At once

Parameter	Meaning	Default setting	Unit	Setting range	Modify	Effective
P2-41	Disturbance observer gain	85	%	0~100	Anytime	At once

9.8.3 Gain adjust parameters

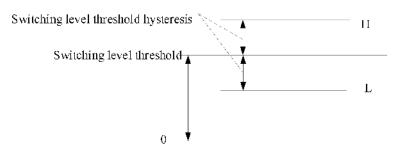

Parameter	Meaning	Default setting	Unit	Setting range	Modify	Effective

9.8.5 Speed loop P-PI mode switching

(1) Speed control mode switching

Parameter		Meaning	Default setting	Modify	Effective
P1-26	n.===X	 0: Do not use mode switching 1: Switching condition based on internal torque command 2: Switching condition based on speed command 3: Switching condition based on acceleration 4: Switching condition based on position deviation 	1	Servo bb	At once
	n.==X=	0: Clear the integral of 0asr1: Keep the speed loop integral unchanged and no longer accumulate	1	1	
P1-27		Mode Switching - Torque command threshold	200	Servo bb	At once
P1-28		Mode Switching - Speed command threshold	0	Servo bb	At once
P1-29		Mode Switching - Acceleration threshold	0	Servo bb	At once
P1-30		Mode switching - Position deviation threshold	0	Servo bb	At once

Asr P/PI mode switching is enabled by default, i.e. P1-26.0=1, and Asr P/PI mode switching is performed based on P1-27 torque command exceeding 200%.

(2) IP control selection

Parameter		Meaning	Default setting	Modify	Effective
P2-03	n.¤X¤¤	0: PI control 1: IP control	0	Servo bb	At once
P1-31		I-P control switching threshold	100	Servo bb	At once

Note: P1-31=0, the speed loop is equivalent to PI control; P1-31=100, the speed loop is equivalent to IP control.

9.9 Gain adjustment

9.9.1 Load shaking

The following reasons cause load to shake

1. The instruction is not smooth enough when the load inertia is too large.

Solutions:

(1) Use position instruction smoothing filter P1-25;

(2) Optimizing the instructions of the upper device to reduce the acceleration of the instructions;

(3) Replace the motor with greater inertia.

2. Servo gain is too small, resulting in insufficient rigidity

Solutions:

(1) Increase the gain parameters and rigidity to enhance the anti-disturbance ability.

3. Insufficient rigidity of mechanism and equipment sloshing

Solutions:

(1) Reducing gain parameters;

(2) Optimize the instructions of the upper device and reduce the acceleration of the instructions.

9.9.2 Vibration

The following causes cause machine vibration:

(1) Vibration due to inappropriate servo gain

Solutions: Reduce gain

(2) Mechanical resonance point

Solutions: Setting notch parameters manually or through mechanical characteristic analysis

9.9.3 Noise

In adaptive mode: (1) Inappropriate servo gain Solutions: Reduce the adaptive control bandwidth (P2-19). In auto-tuning mode: (1) Inappropriate servo gain Solutions: Under the mode of rapid adjustment, reduce the rigidity level. Automatic Adjustment Mode: Reducing Model Loop Gain P2-49 (1) Noise due to mechanical resonance Solutions: Refer to 9.9.2 vibration.

Although PDO watch dog trigger is effective (SyncManager: Bit6 which is the register 0804h set to 1), when the detection timeout value of PDO watchdog timer cycle setup (registers 0400h and 0420h) was less than "communication cycle *2". ESM state after alarm: PreOP ESC register AL Status Code:001Fh	Set up detection timeout value of watchdog timer correctly The servo alarm can be cleared by setting SM2013+20* (N-1) or by servo panel F0-00=1.
E-815	DC error protection	DC setting is wrong. A value other than the following was set to bit 2-0 of 0981h (Activation) of the ESC register: bit2-0=000b; bit2-0=011b ESM state after alarm: PreOP ESC register AL Status Code:0030h	Check setting of DC mode. The servo alarm can be cleared by setting SM2013+20 * (N-1) or by servo panel F0-00=1.
E-816	SM event mode	SM event mode which is not supported was	- 1C32h-01h(Sync mode) should set

Alarm code		Reasons	Solution
	error protection	set up. 1C32/1C33-01 Set values other than 00, 01 and 02. - When 000b was set to bit 2-0 of 0981h of the ESC register, SM2 setting was set to only either 1C32h-01h or 1C33h-01h. ESM state after alarm:PreOP ESC register AL Status Code:0028h	 up 00h(FreeRun), 01h(SM2), or 02h(DC SYNC0). - 1C33h-01h(Sync mode) should set up 00h(FreeRun), 02h(DC SYNC0), or 22h (SM2). - Set same value to 1C32h-01h and 1C33h-01h. The servo alarm can be cleared by setting SM2013+20*(N-1) or by servo panel F0-00=1.
E-817	SyncManager2/3 error protection	A setup of SyncManager3 was set as the unjust value. - A Physical Start Address (ESC register 0818h) setup of SyncManager3 is inaccurate. -Receiving area overlaps with the area for the transmission. - The area for transmission/reception of Mailbox overlaps the area for transmission/reception of SyncManager2/3	The servo alarm can be cleared by setting SM2013+20*(N-1) or by servo panel F0-00=1.
		 Addressing transmission and reception area is an odd number. Start addresses is out of range. A Length (ESC register 0812h/081Ah) setup of SyncManager2 is inaccurate. Different from RxPDO size. A Control Register (ESC register 0814h/081Ch) setup of SyncManager2 is inaccurate. Set other than 100110b to bit5-0 ESM state after alarm: PreOP ESC register AL Status Code:001Dh/001Eh 	
E-850	TxPDO assignment error protection	The data size of TxPDO map is set up exceeding 24 bytes ESM state after alarm: PreOP ESC register AL Status Code: 0024h	TxPDO data size is set up within 24 bytes. The servo alarm can be cleared by setting SM2013+20 * (N-1) or by servo panel F0-00=1.
E-851	RxPDOThe data size of RxPDO map is set upassignment errorexceeding 24 bytes.protectionESM state after alarm: PreOPESC register AL Status Code:0025h		RxPDO data size is set up within 32 bytes. The servo alarm can be cleared by setting SM2013+20 * (N-1) or by servo panel F0-00=1.
E-881	Control mode	- The PDS state was changed to "Operation	Check preset value of 6060h(Modes

Alarm		Reasons	Solution
code	a attin a suman	angled" when the value set to 6060h (Madas	of an aution)
	setting error protection	enabled" when the value set to 6060h (Modes of operation) is 0 and the value set to 6061h (Modes of operation display) is 0.	of operation). The servo alarm can be cleared by setting SM2013+20 * (N-1) or by servo panel F0-00=1.
		Unsupported control mode is set to 6060h (Modes of operation). A control mode other than position control is set to 6060h (Modes of operation) in full-closed control.	1
		ESM state after alarm: It remains in the present ESM state. ESC register AL Status Code:0000h	
E-882	ESM requirements during operation error protection	 When a PDS state was "Operation enabled" or "Quick stop active", the transition command to other ESM state was received. ESM state after alarm: A state transition request from host contoller is followed. 	Check the state transition request from higher rank equipment. The servo alarm can be cleared by setting SM2013+20 * (N-1) or by servo panel F0-00=1.
		ESC register AL Status Code: 0000h	
E-883	Improper operation error protection	- When EXT1/EXT2 is not assigned to input signal, EXT1/EXT2 was selected in trigger selection of a touch probe (60B8h (Touch probe function)). The calculation result of electronic gear ratio fell outside the range of 1/1000 to 1000 times;	The servo alarm can be cleared by setting SM2013+20 * (N-1) or by servo panel F0-00=1.
		 In the calculation process of electronic gear ratio, the denominator or numerator exceeds an unsigned 64-bit size. In the final calculation result of electronic gear ratio, the denominator or numerator exceeds an unsigned 32-bit size. 	
		 When Z-phase is chosen by trigger selection of a touch probe (60B8h(Touch probe function)) at the time of absolute mode of full closed. When the software limit function is enabled, a wraparound occurred to the actual position or command position. 	
		ESM state after alarm: It remains in the present ESM state.

01	4	E-014	FPGA Access error	 Program damage Device damage Serious external interference 	Please contact the agent or the manufacturer
	5	E-015	Program running error	Program damage	Please contact the agent or the manufacturer
	7	E-017	Processor	Program damage	Please contact the agent or the

Туре		Code	Description	Reasons	Solutions
			Running Timeout		manufacturer
	9	E-019	System password error	Program damage	Please contact the agent or the manufacturer
	0	E-020	Parameter loading error	Faliure of parameter self-checking	Re-energizing can restore default parameters, if there are repeated problems, please contact the agent or manufacturer.
	1	E-021	Parameter range beyond limit	Setting values are not within the prescribed range	Check parameters and reset them
	2	E-022	Parameter conflict	Conflict of TREF or VREF Function Settings	 Check whether the parameter settings meet the requirements; Under P0-01=4 mode, P3-00 will alarm when set to 1
02	3	E-023	Sampling channel setting error	Error setting of custom output trigger channel or data monitoring channel	Check that the settings are correct
	4	E-024	Parameter conflict	Low voltage of power grid	 If it is single-phase 220V power supply, please connect L1 and L3. show E-024 immediately after power failure Resetting parameters
	5	E-025	Erase FLASH error	Abnormal parameter preservation during power failure	Please contact the agent or the manufacturer
	6	E-026	Initialization FLASH error	Power supply instability of FLASH chip	Please contact the agent or the manufacturer
	8	E-028	EEPROM write in error	Voltage instability or chip abnormality	Please contact the agent or the manufacturer
02			U0-05 is higher than the actual preset threshold, 220V Power	High voltage of power grid	Check the fluctuation of power grid, 220V driver normal voltage range 200V ~ 240V, 380V driver normal voltage range 360V ~ 420V. If the voltage fluctuation is large, it is recommended to use the correct voltage source and regulator. (1) Connect external regenerative
03	0	E-030	Supply Machine (U0-05≥402V) 380V Power Supply Machine (U0-05≥780V)		resistor, (220V: bus voltage U0-05 = 392 discharge starts, U-05 = 377 discharge ends;

Туре	;	Code	Description	Reasons	Solutions
					(4) Reduce start-stop frequency(5) Replacement of larger power drivers and motors
				damage or excessive resistance value	Check the regenerative resistor and replace the external resistor with the appropriate resistance value.
				Acceleration and deceleration time is too short	Extending Acceleration and Deceleration Time
					The AC gear of the multimeter measures the input value of the servo LN (R/S/T), which is $220V \pm 10\%$ of the normal value. If the power supply voltage is more than $220V+10\%$ ($380V+10\%$), check the power supply voltage; if the power supply voltage is normal, then the servo BB state, monitor U0-05, the voltage measured by the multimeter * $1.414 < U0-05$ (within $10V$ error), then the servo driver is faulty and needs to be sent back for repair.
			Bus voltage	grid when normal power on	 (1) Check the fluctuation of power grid. The normal voltage range of 220V driver is 200V~240V. If the voltage fluctuation is large, the voltage regulator is recommended. (2) Replacement of larger capacity transformers
04	0	E-040		Instantaneous power failure Hardware Fault of Driver Internal Sampling Circuit	Re-energize after voltage stabilization The AC gear of the multimeter measures the input value of the servo LN (R/S/T), which is $220V \pm 10\%$ of the normal value. If $< 220V + 10\%$ ($380V + 10\%$), then check the supply voltage; if the supply voltage is normal, then servo BB state, monitoring U0-05, multimeter measurement voltage * 1.414 > U0-05 (error within 10V), then the servo driver is faulty and needs to be sent back for repair
	1	E-041	Driver power down	Driver power off	Check the power supply

Туре		Code	Description	Reasons	Solutions
	3	E-043	Bus Voltage	low voltage of power grid when normal power on	low voltage of power grid when normal power on
			Charging Failure	Hardware damage	When the driver is on, please pay attention to whether there is relay actuation sound
	4	E-044	-	Three phase input power supply is lack of phase	Check the power supply
			The temperature is too high (The temperature alarm of the linear drive motor is related to the	Running under heavy load for a long time	Re-consider the capacity of the motor, monitor the U0-02 torque during operation, whether it is in the value of more than 100 for a long time, if yes, please chose the large-capacity motor or load reduction.
	0	E-060	 thermistor and only supports PT100 thermistor. Other types of thermistor are 	Excessive ambient temperature	 Enhance ventilation measures and reduce environmental temperature; Check if the fan rotates when the servo is enabled; PT100 thermistor detects high temperature, fan turned on
			shielded from this alarm on the upper computer.)	Fan damage	Change the fan
	1	E-061	Motor overheat	Alarm for motor temperature exceeding 140 °C	\cup
06	3	E-063	Thermocouple disconnection alarm	Motor thermocouple breakage	Check the connection status of external thermocouples; Can be disabled when setting motor parameters in the upper computer wizard;
		E-080	Overspeed (actual speed ≥ P3-21/P3-22) The maximum forward speed is P3-21 and the maximum reverse speed is P3-22.	Motor speed too fast	 The maximum speed limit value P3-21/P3-22 was reduced. To confirm whether the external force makes the motor rotate too fast, whether the pulse input frequency is too high, and whether the electronic gear ratio is too large.
	0			Encoder fault	 (1) Check the encoder cable or change a new one (2) Set the servo driver to BB state and the driver to U-10. Rotate the motor shaft slowly by hand to see if the value of U-10 changes normally, increasing in one direction and decreasing in one direction (0-9999 cycle display).

Туре		Code	Description	Reasons	Solutions	
				Parameter setting	When the actual speed is greater than the P3-21/P3-22 value, an alarm will be given	
		E-082	Encoder zero position deviation protection 1	Zero position deviation of motor encoder	 Check whether the three phases of the power line are connected according to the phase sequence of UVW Check the encoder zero position, please contact the manufacturer's technical support 	
	3	E-083	Speed command exceeds the limit	The speed command in position mode exceeds the set value of 13 * P3-21/P3-22	 Check the set values of P3-21/P3-22 Abnormal position command 	
	0	E-100	Position offset too large	In position control, the difference between the given position and the actual position exceeds the limit value	 (1) Observe whether the motor is blocked or not. (2) Reducing the given speed of position; (3) Increase the deviation pulse limit P0-23. 	
10	1	E-101	Sudden change of position command	The instruction difference for cycle position is too large	0	
11	0	E-110	External UVW Short Circuit Discovered in Self-Inspection	Driver UVW output short circuit or motor failure	 Measure whether the UVW phase to phase resistance of the motor is balanced. If the phase to phase resistance is unbalanced, replace the motor; Measure whether there is a short circuit between the UVW and PE of the motor. If there is a short circuit, replace the motor; Measure the UVW output on the driver side using a multimeter (diode gear) with a black probe P+and a red probe to measure UVW; Red probe P -, black probe for measuring UVW; If any of the 6 pressure drop values is 0, replace the driver

25	0	E-250	Homing error	 P9-15 is not zero and the total homing time exceeds the time set by P9-15; New homing function parameter setting error 	 Increase P9-15; Ensure that the direction of the mechanical offset (P9-19, P9-20) is opposite to the homing direction; Check if there is a problem with the origin signal; Check the parameter settings of the new homing function
	0	E-260	Over range alarm	Overrun signal was detected and the overrun processing mode was configured to alarm	If you do not want to alarm immediately when the overrun occurs, you can change the overrun signal processing mode.
	1	E-261	Overrun signal connection error	 When the motor is in forward rotation, it encounters reverse overrun signal. When the motor is in reverse rotation, it encounters forward overrun signal. 	Check over-run signal connection and over-run terminal allocation.
26	2	E-262	Control stop timeout	(1) Excessive inertia(2) Stop timeouts too short	 Reduce inertia or use brake motor; Increase the stop timeout time P0-30
	4	E-264	Excessive vibration	by external forces (2) Load inertia is large and the setting of load inertia ratio is wrong or the gain is too small, which leads to the	completed (0.8^* first peak > second

Туре	e	Code	Description	Reasons	Solutions
	5	E-265	Excessive motor vibration	Mechanical vibration	Check the motor installation
28	0	E-280	Failed to read motor parameters	 Motor matching error; The encoder cable is not connected or wired incorrectly, or the cable is loose 	 After professional personnel confirm that the driver and motor are compatible and can be used together. Check the connection of the encoder cable, measure the continuity of the encoder cable, or replace the encoder cable to check. Check whether the driver and motor are normal. You can determine whether it is a problem with the driver or motor body by replacing it with a new one. It needs to be sent back to the manufacturer for inspection.
	1	E-281	Error writing data to encoder EEPROM	Request to write EEPROM failed	On the premise that the driver and motor are matched and can be used together, read the alarm shielding position of motor parameters through P0-53, and set the motor code of P0-33 correctly
32	0	E-320	Driver cascading alarm	Terminal emergency alarm function	Check if there are alarm output signals from other drivers connected to the SI input terminal of the driver, and prioritize processing this alarm. Correctly setting parameters P5-68
34	0	E-340	STO status is not synchronized	STO1 and STO2 input states are inconsistent	 Ensure that STO1 and STO2 are disconnected simultaneously; If a certain STO is still in a high level state after disconnecting the 24V power supply, please contact the original factory technical support.
	2	E-342	STO buffer circuit abnormal alarm	STO buffer circuit abnormality	Please contact the original factory technical support.
	3	E-343	EDM circuit error	EDM output signal error	Please contact the original factory technical support.

10.3 Alarm read

 $0000H \sim FEFFh$ is defined according to IEC61800-7-201.

 $FF00h \sim FFFFh$ can be defined according to users, as follows.

The lower 8 bits of the defined value (FF00h \sim FFFFh) shown in the following table indicates the main code of the alarm number of the servo abnormal (alarm). (the secondary code of the alarm number is not read.) In addition, the main code of alarm number is represented by hexadecimal number.

Index	Sub-Index	Name/Description	Range	DateType	Access	PDO	Op-mode	
603Fh	00h	Error code	0~65535	U16	ro	TxPDO	All	
		Now the alarm of th	e servo driv	er (only the	main number).			
		When the alarm doe	s not occur,	it will displa	у 0000Н.			
		When an alarm occu	ırs, an alarm	n is displayed	l.			
		FF**h						
		Alarm (main) No. (00h \sim FFH)						
		(Example) FF03h $03h = 3d$ E-030 (overvoltage protection) occurs						
		FF55h 55h = 85d E-850 (TxPDO configuration error protection), E-851 (RxPDO						
		configuration error protection)						
		any one of them occurs						
		As an exception, A0	00h is displ	ayed in the c	ase of E-817 (Sy	ncmanager 2/	3 setting error).	

Alarm code can also be read through SDO instruction. U1-00 corresponding object dictionary is 0x3100. The command is as follows:

Read the value in slave object dictionary 0x3100: 00 (current alarm code) with station number 0 to register D0. (Refer to *XDH/XLH motion control manual* for the specific use of this instruction)

10.4 Alarm clear

Reset method of protection function associated with EtherCAT that can be cleared in case of abnormal (alarm) The following methods (1)(2)(3)(4) can be used for abnormal (alarm) clearing no matter which method. In addition, for protection functions other than EtherCAT association, please refer to the basic function specifications of technical manual.

Method (1): bit4 (Error Ind ACK) of AL control is set to "1".

After that, bit7 of 6040h (control word) is cleared by setting $0 \rightarrow 1$ (sending Fault result command). After the alarm is cleared, the PDS status is converted from Fault to Switch on disabled.

Method (2): carry out abnormal (alarm) clearing by servo driver (panel F0-00, upper computer software). After the alarm is cleared, the PDS status is transferred from Fault to Switch on disabled.

Method ③: the external alarm clear input (A-CLR) of servo driver changes from OFF state to ON state. After the alarm is cleared, the PDS status is migrated from Fault to Switch on disabled.

Method (4): Clear the alarm through SDO instruction. The object dictionary corresponding to F0-00 is 0x4000. The command is as follows:

M0		_
├── î	EC_SDOWR K0 H4000 K0 D0 K2 D2 M0	Н

When an alarm occurs, write 1 to D0 to clear the alarm.

(Refer to XDH/XLH motion control manual for the specific use of this instruction)

11 Applications

11.1 XINJE XG2/XDH and DL6 EtherCAT communication

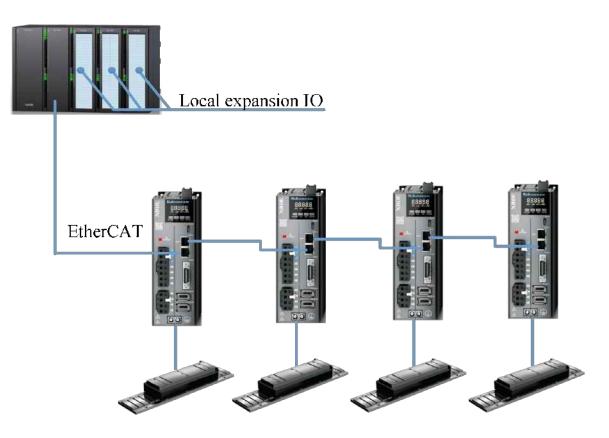

This communication case takes DS5C1-20P4-PTA as an example, and the bus configuration of DL6-2003/2006 (- GS) is the same as DS5C1.

11.1.1 System configuration

Name	Model	Quantity	Note
Software	Xinje PLC software	1	
Xinje servo	DL6-2003(-GS)	1	
Cable	JC-CB-3	some	Connect servo and PC

11.1.2 System topology

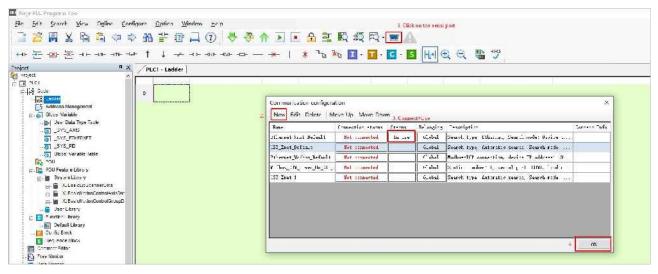

The DL6 drive network port plug follows the bottom in and top out standard, for example: the main station leads out the network cable and connects it to the IN network port of the first drive, leads out the network cable from the OUT network port of the first drive and then connects it to the IN network port of the second drive, and so on.

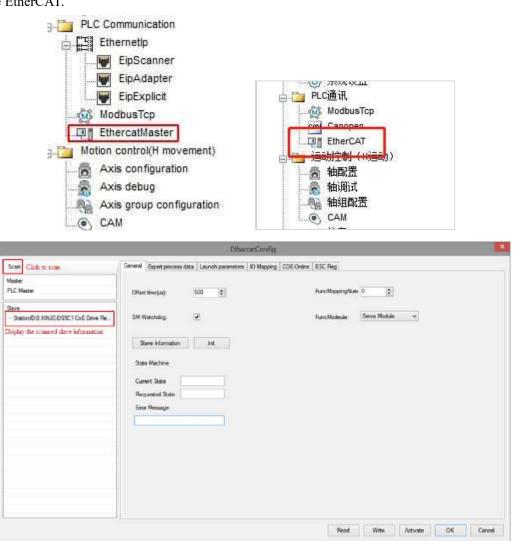

11.1.3 Debugging steps

Debugging various EtherCAT bus control modes, taking H motion as an example (in PLC programming software versions 3.7.14 and above, H motion is default), SFD811=1).

1. Connect PLC.

2. Configure EtherCAT.

Confirm the PDO that needs to be configured in this mode in the [Expert Engineering Data].

						Read	Write	Activat	e OK Cancel

There are three default configurations in the startup parameters, among which 6060h is the slave operation mode, with a default value of 8 (CSP mode); 60C2-1 and 60C2-2 are synchronization unit cycles, 60C2-1 is the value of synchronization unit cycle, and 60C2-2 is the unit of synchronization unit cycle. For example, the default synchronization unit cycle is 100×10^{-5} s, which is 1000us. (This parameter will automatically change with the synchronization cycle of the main station configuration and does not require manual modification).

(4) 【IO mapping】 default start address is HD10000, which can be changed if necessary.

(5) After setting all the parameters, click [write] \rightarrow [activate] \rightarrow [OK]. The parameters will take effect after the activation is successful.

- When M20 goes from OFF to ON, perform periodic position control on the axis specified by HD300. After successful execution, M21 is set to ON to indicate that the axis is in a periodic control state. By periodically assigning values to HD300, control of the axis is achieved.
- Before triggering the command, please ensure that the value of HD300 is the same as the current position, otherwise the position will generate a step.
- Periodic position control requires periodic writing of the target position value into the register, with no significant changes in position, to avoid causing the axis to fly due to a large difference between the given cycle position and the previous cycle position.

6 After the activation is completed, the slave station state machine (SD8021) will change state from $1 \rightarrow 2 \rightarrow 4 \rightarrow 8$, 8 means OP state. At this time, both SDO and PDO can receive and send messages.

(7) After enabling ON, HD10000 (mapping for 6040h) will indicate the slave enable state from $6 \rightarrow 7 \rightarrow 15$, which can be assigned a value to HD10006 (mapping for 6071h) as the given torque in CST mode.

(8) In CST mode, the current given torque can be monitored through HD10006 (mapping of 6071h), the current actual position can be monitored through HD10012 (mapping of 6064h), the current actual speed can be monitored through HD10014 (mapping of 606Ch), the current actual torque can be monitored through HD10016 (mapping of 6077h), and the maximum motor speed can be limited through 6080h.

Note: After adding the speed limit parameter, ensure that the speed limit is within the appropriate range during operation.

(9) Set the homing mode(6098h).

This setting range is -2~37 (currently supports methods -2~14, 17~30, 33, 34, 35, 37)

(10) After enabling ON, HD10000 (6040h mapping) will go from $6 \rightarrow 7 \rightarrow 15$ to indicate the slave station's enabled state, and then HD10000 (6040h mapping) will go from $15 \rightarrow 31$ to enable the homing. During the homing process, if the origin signal is triggered, it will slow down and stop according to the corresponding way of homing. To homing again, first change 6040h to 15, and then HD10000 (mapping of 6040h) $15 \rightarrow 31$.

(6) After the activation is completed, the slave station state machine (SD8021) will from $1 \rightarrow 2 \rightarrow 4 \rightarrow 8$, 8 means the OP status. At this time, SDO and PDO can receive and send messages.

(7) Modify the control word 6040 ($6 \rightarrow 15$) to enable the slave station and move the motor by setting the target speed, acceleration and deceleration and other parameters.

(8) In PV mode, data can be set and monitored through I/O mapping addresses. For example, the control word of axis 1 can be modified through HD10000 (6040h mapping) to enable or disable the motor. The actual position of the current motor on axis 1 can be monitored through HD10012 (6064h mapping), and the actual speed of axis 1 can be monitored through HD10012 (6064h mapping).

(6) After activation, the slave station state machine (SD8021) will change from $1 \rightarrow 2 \rightarrow 4 \rightarrow 8$, 8 indicating the OP state. At this time, both SDO and PDO can receive and send messages.

(7) Modify the control word 6040 (6 \rightarrow 15) to enable the slave station to move the motor by setting the target torque, torque slope and other parameters.

(8) In TQ mode, data can be set and monitored through I/O mapping addresses. For example, the control word of axis 1 can be modified through HD10000 (6040h mapping) to enable or disable the motor. The actual torque of the current motor on axis 1 can be monitored through HD10016 (6077h mapping), and the torque slope of axis 1 can be set through HD10038 (6087h mapping).

(3) When the level signal connected to the driver SI1 or SI2 jumps, the probe function is triggered, and the probe value is locked in the corresponding COE object words 0x60BA to 0x60BD. When reading the probe value, you need to add the corresponding probe value object (0x60BA-0x60BD) to TxPDO to facilitate data collection.

Select 1600, 1A00 in [Expert process data] \rightarrow [PDO list], add 60B8h in 1600, add 60BAh in 1A00, 60BCh (take the rising edge of the two probe signals as an example. If the falling edge is collected, 60BBh and 60BDh can be added).

(6) After activation, the slave station state machine (SD8021) will change from $1 \rightarrow 2 \rightarrow 4 \rightarrow 8$, 8 indicating the OP state. At this time, both SDO and PDO can receive and send messages.

(7) After enabling the slave station, the probe function can be activated by modifying HD10024 (60B8h mapping).
(8) After activating the probe function, the rising edge clamping value of probe 1 can be monitored through HD10022 (60BAh mapping), the rising edge clamping value of probe 2 can be monitored through HD10024 (60BCh mapping), the current probe status can be monitored through HD10026 (60B9h mapping), the current actual position of the motor can be monitored through HD10012 (6064h), and the current actual speed can be

monitored through HD10014 (606Ch mapping).

11.2 Beckhoff TWINCAT and Xinje DL6

Beckhoff TwinCAT control software is used as the master station and Xinje servo is used as the slave station to realize EtherCAT motion control.

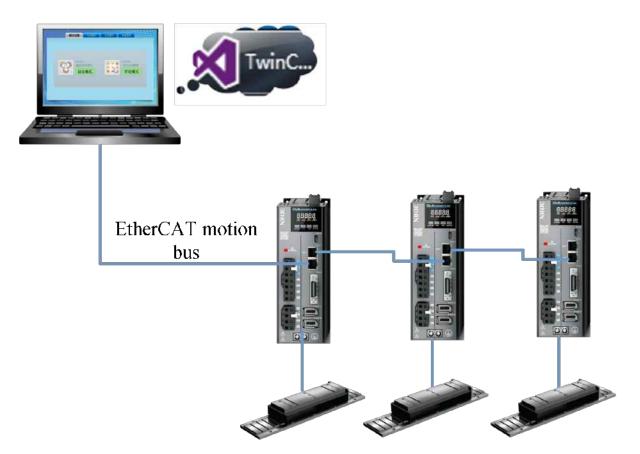

This communication case takes DS5C1-20P4-PTA as an example, and the bus configuration of DL6-2003/2006 (- GS) is the same as DS5C1.

11.2.1 System configuration

Name	Model	Quantity	Note
Servo software	TWINCAT XAE(VS 2013)	1	TC31-FULL-Setup.3.14022.27
XINJE servo	DL6-2003(-GS)	1	
Ethernet cable	JC-CA-3	Some	Used for connecting computer and
	JC-CA-5	Some	servos

11.2.2 System configuration

DL6 servo driver has two communication network ports, which follow the principle of "bottom in and top out" shall be followed when connecting. The master station must be connected with the network port under the CN1 port of the first servo, and then the network port above the first servo is connected with the network port below the second servo, and so on.

11.2.3 Commissioning steps

1. Add XML file

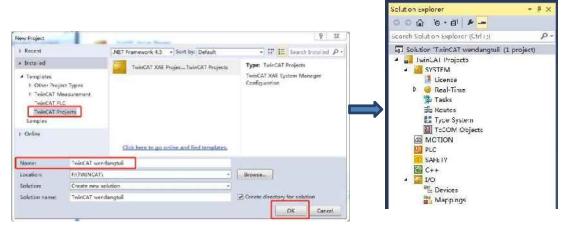

Before opening the software operation, we need to copy the DS5C2 XML file to the TwinCAT installation directory, and the default path is C:\TwinCAT\3.1\Config\Io\EtherCAT.

2. New project

Open the TwinCAT XAE(VS 2013) software and new a project:

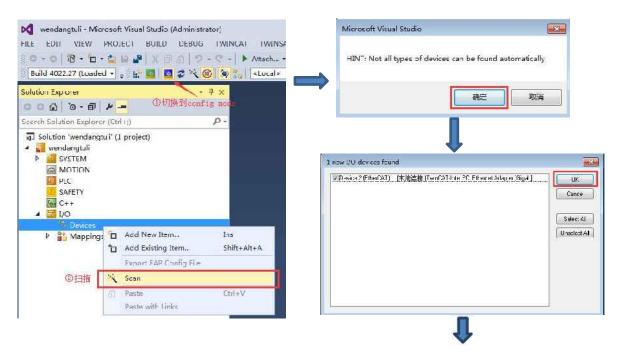

(1) FILE—NEW—Project;

(2)Select TwinCAT Project, enter the project name and the project saving path, and click OK. The following interface will appear:

3. Hardware scanning

If the controller is not in config mode, click **and the controller is not in config mode first.** Then right click "Device" and click "Scan" to scan the slave station of EtherCAT.

			Microsoft Visual Studio	23
EtherCAT drive(s) add Append linked axis to:	NC - Configuration CNC - Configuration		Scan for boxes	
		Cancel	是(Y)	否(N)

н

Click "NC Configuration".

After the scanning is completed, Axis1 can be seen in "Motion-NC axis", corresponding to the servo motor connected to the servo driver, and DS5C2 can be seen in the "Device".

4. Connect NC axis and physical axis

Can select the physical axis associated with the NC axis through Axis1 Settings Link to, and this link will be automatically added when scanning hardware. Alternatively, you can manually right-click on the axis, click Append axis to add the axis, and manually link the NC axis to the physical axis. This window displays the correspondence between the NC axis and the physical axis.

- 5. Debugging through NC-Online interface
- (1) Switch TwinCAT to the running mode, and then click "MOTION- Axis1- Online" to debug the servo axis.

If you don't see the current position of the shaft in the "Online", please make sure that the motor model addition and activation configuration are completed normally.

(2)Click Set, manually check Controller, Feed Fw, Feed Bw and set Override(%), then click OK. Or directly click "All" to enable the axis, and automatically set the Override to 100%.

neral Settings Parameter Dynamics Unline Fun -O.00020 ag fistence [m] Actual Yelocity: [mm/s] 0.0013 (-0.006, 0.006) verrice: [%] Tetal / Centrel %] 100.0000 % C.CO / C.CO % Status (log) Status (skys) Ready NOT Moving Calibrated Moving Fw Has Job Moving Bw introller Kv-Factor: [mm/s/mn] larget Position: [mm] 0 1 2 200 Target 7elo 0 1 2 200 Calibrated Moving Bw	Saturint Imm] -0.0028 Saturint Saturint [mm/s] 0.0000 Brown Brown 0.0000 Brown 0.0000 Brown 0.0000 Brown 0.0000 Brown 0.0000 Brown Saturint Controlle Saturint Feed Bw Brown elocity: [mm/s] sity: [mm/s]	Set Enabling Controller Feed Fw Feed Bw Override [%] 100	OK Cancel

(5) When the NC reports an error, there will be an error code in the "Error". F8 is the reset button. Press F8 to reset the error. F9 is the origin finding button. After pressing F9, the axis position will change to 99999... And move slowly. However, the origin signal requires external hardware signal, which cannot be captured in the Online window. Therefore, F9 is not used to return to the origin generally, but realized through programming in the program.

Refer to "TC3 training material V1.1.0" for more single axis debugging functions.

- 6. Control DL6 servo motor by PLC control programming
- (1) Add motion control library files and axis type variables

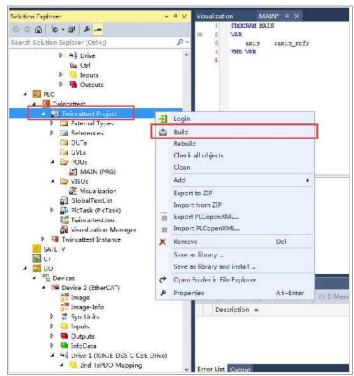

Create a new project under PLC and click "PLC-References-Add library...". In the pop-up dialog box, find "Motion -- PTP -- TC2_MC2" and select Add.

Click POUs -MAIN(PRG) ,create an Axis_ref type at the main program. Axis_ Ref is a structure, mainly used for data exchange between NC and PLC. It also contains some other structures. We call this Axis_ref variable the axis variable.

After the program is written, compile it to see if it is wrong. The project of this instance is named Twincattest, so find Twincattest project, right-click it, and then select "Build" and click it.

After successful compilation, you will see the Correspond variable in the Instanc directory of the project. After the Build compilation is successful, you can bind two variables separately under PlcTask Input and PlcTask Output in Twincattest Instance.

Search Solution Explorer (Ctrl+;)	p.

(2)Connect variable between NC and PLC

Click "Motion-Axes", double click Axis 1, find "Settings-Link to PLC..." from the interface on the right. Link Axis1 to the corresponding PLC, and then NC and PLC can interact with each other through this link.

(3) Call function block to control the axis motion

On the POUs-MAIN (PRG) interface, declare one MC_POWER function block and one MC_MoveAbsolute function block, where MC_Power is used to control shaft enable, MC_ Moveabsolute is used to control the absolute position of the axis.

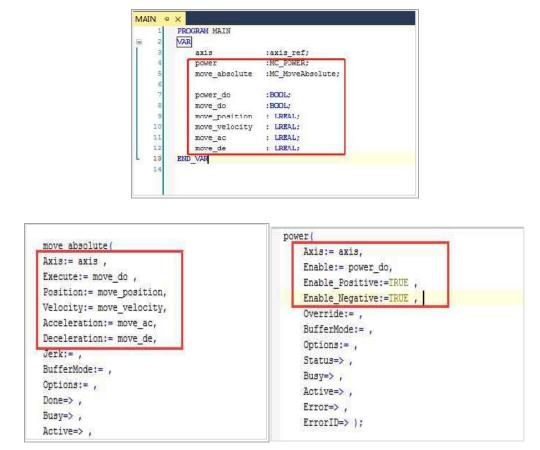

PROGRAM MAIN	
VAR	
axis	:axis_ref;
power	:MC_POWER;
move absolute	:MC MoveAbsolute;

Press F2 in the program writing window and select power and move_absolute in "Categories——Instance Calls" to call the defined function block into the program.

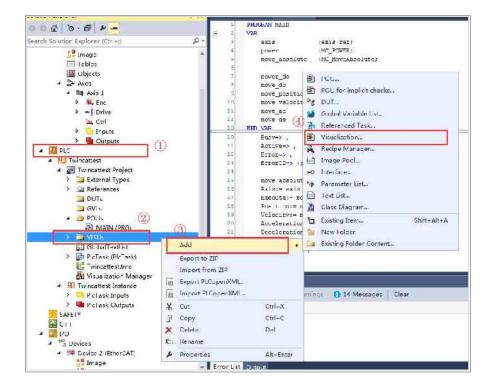

Variables	A Nome	Турс	Orgn
Module Calls	* @ axis	axis_ref	
Instance Cals	t - ∉ movc absolute	MC MoveAbsolu	ie.
Struttun Books	+ @ power	MC_PONIS?

✓ Soutured view ogumentation: avds: avds_re ⁶ / (VAR)	L_15		

Fill in all the parameters in the function block. Enable represents the enable position, Enabled_Positive represents allowing forward rotation, Enabled_Negative represents allowing reverse rotation, Override represents the speed ratio, Axis represents the corresponding axis, Position represents the positioning position, Velocity represents the positioning speed, Acceleration represents acceleration, and Deceleration represents deceleration. Additionally, declare two boolean type variables power_do and move_do as trigger bits for the enable and absolute position

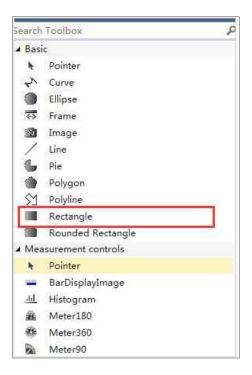

motion function blocks, and declare an Lreal type variable as the position, velocity, and acceleration/deceleration for absolute position motion.

Right click "PLC-VISUs", click Add from the pop-up menu, and then select Visualization from the new menu to create a visual interface.

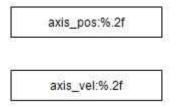

Select the rectangle in the toolbar of the added VISU interface and drag a control. Double click the rectangle box control to set.

Double click the control, and set parameters in Property as shown in the figure. Set Texts—Text-axis_pos: %.2f, %.2f represents the data type of floating-point number, display the value of the associated variable (that is, the variable pointed to by "Text variables—Text variable", and only two decimal places are reserved. Enter MAIN.axis.NcToPlc.ActPos in Text variable, indicating that the control points to the actual position in the axis variable.

11.3 CODESYS and XINJE DL6 Ethercat communication example

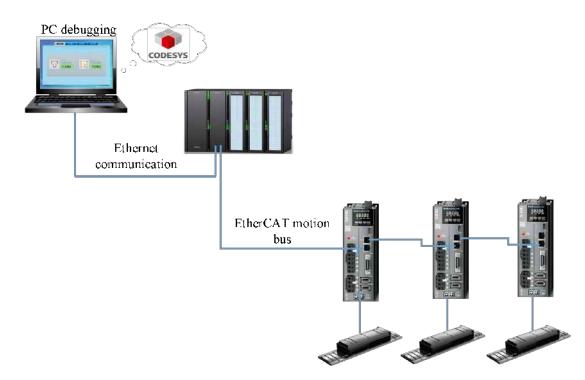

This example will explain how Codesys motion control software realizes EtherCAT motion control when it is used as EtherCAT master station (Xinje XS3 series PLC is only used as a hardware platform) and Xinje DL6 series servo is used as slave station.

Note: This communication case takes DS5C1-20P4-PTA as an example, and the bus configuration of DL6-2003/2006 (- GS) is the same as DS5C1.

11.3.1 System topology

Name	Model	Quantity	Note
Software	CODESYS	1	Software version: V3.5 SP13
			Patch 1
Hardware	XS3 series PLC	1	
Servo	DL6-2003(-GS)	3	
Network cable	JC-CA-3	Some	Connect PC and servo

11.3.2 System topology

This is a Codesys control system based on traditional hard PLC. In this scheme, the PLC development system generally runs on an ordinary PC, while the traditional hard PLC only serves as a hardware platform. The real-time core of the soft PLC is installed in the traditional hard PLC, and the system program compiled by the development system is downloaded into the hard PLC. The control system diagram is shown in the above figure.

XS3 series PLC has upper and lower network ports. The upper network port is Ethernet/IP, which is used to

connect the Codesys upper computer. The lower network port is an EtherCAT connection port, which is used to connect Xinje DL6 series servo to realize EtherCAT communication. The two communication network ports of Xinje DL6 series servo drivers should follow the principle of "bottom in and top out".

11.3.3 Debugging steps

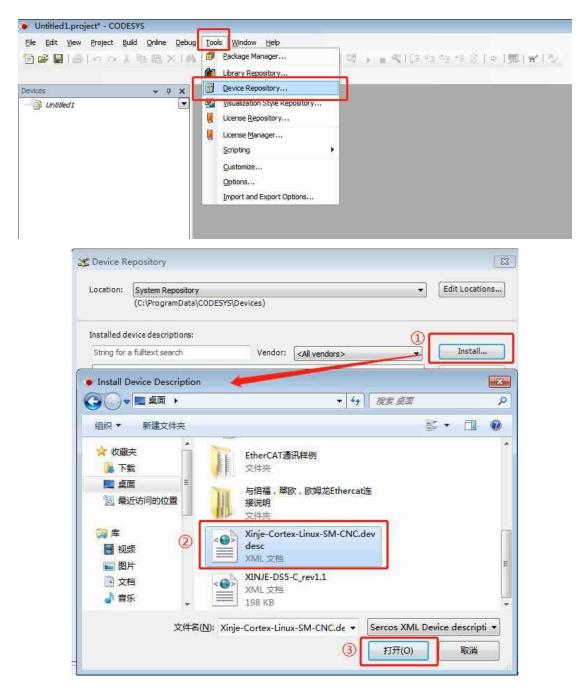

1)New project

Double click to open Codesys. Click New Project, input project name and save path.

Basic Operations	Latest News
	Latest News
1 New Project	The current news channel might not be valid or your Internet connection the Options dialog and select the Load&Save category.
Open Project from PLC	E New Project

	Standard project w
	A project containing one device, one application, and an empty implementation for PLC_PRG
	Name: Untitled1
	Location: D:\信捷\Sodesys -

2)Add XML file

Open Tools/device repository, add XML file of master and slave station. First, add the XML file of the master station device. Click Tools -- device repository in turn, click install in the pop-up dialog box, select the path where the XML file is located, find the XML file, select it, and click open.

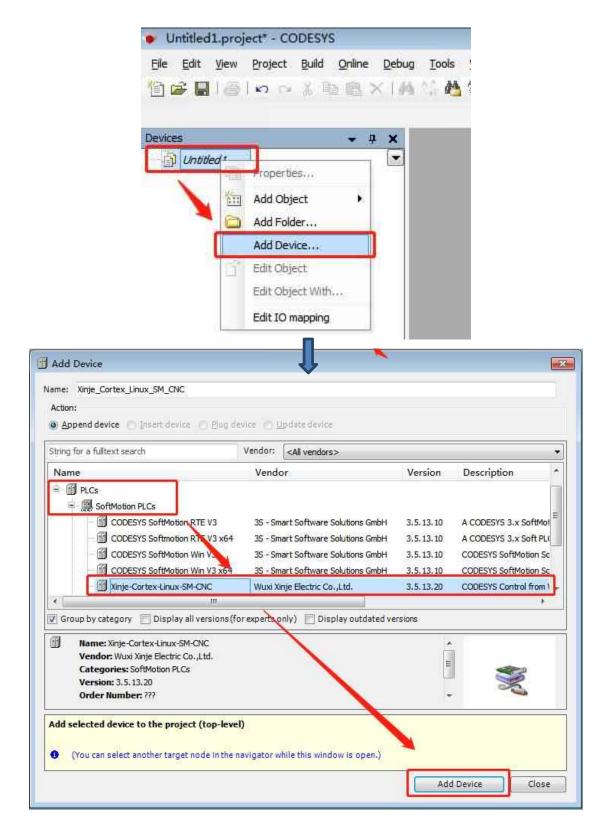

After opening, the installation is completed, as shown in the following figure. Similarly, install the slave XML file (XINJE-DL6-ECT(V1.2)) in the same way.

4)Gateway communication settings

Double click Xinje_Cortex_Linux_SM_CNC, click Scan netwook in the communication settings tab, search for PLCs in the same network segment, and click OK after finding them. As shown in the figure below, the equipment name of the PLC is XINJE-XS3.

Note: Ethernet connection requires that the IP address of the connected device (PC) and the IP address of the PLC are in the same network segment, so confirm whether the IP address setting of the PC meets the requirements before connecting.

Double click the added POU to program in the POU interface.

Note: POU should be added to the task, because subsequent compilation commands only compile the programs added to the task. If the created POU is not added to the task, the compile command does not perform syntax check for the POU. Right click EtherCAT_ Task, select Add object -- Program call, fill in "POU" in the dialog box "Add Program Call", and finally click Add.

Call the function block

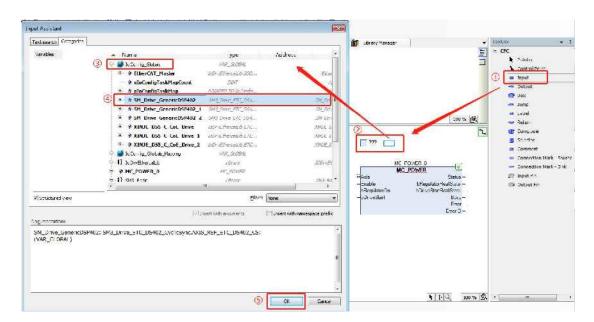

On the POU interface, calling an MC_POWER function block to control the axis enable. Select the box in the toolbar, drag it into the programming interface, and enter MC_POWER.

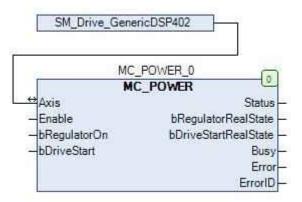

Link this function block to the variable of the first slave station axis, as shown in the figure, enter MC_POWER_0, the programming interface will automatically generate variables to be declared.

	⇔Axis —Enable —bRegulatorOn —bDriveStart		Status IatorRealState StartRealState Busy Error ErrorID	-	
	Auto Declare	-			
	Scope: [VAR •]	Name: MC_POWER_0	Type: MC_POWER	• >>	
	Qbject: POU [Applcation]	Initialization:	Address

2	VAR				
3		MC_POWER; D	eclare variabl	es	
4	END_VAR				
5					

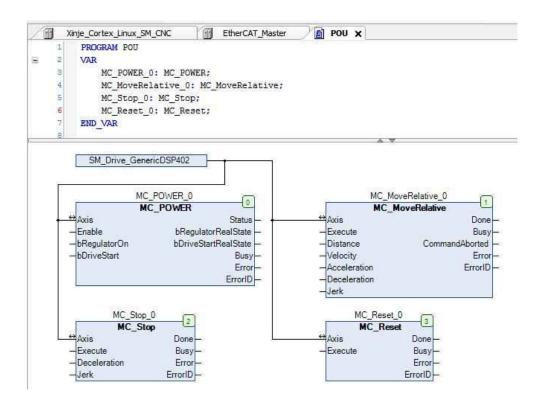

Add input and link the function block to the first slave station axis. Select Input, drag it in the programming interface, double click this object, click is elect IoConfig_Globals-- SM_Drive_GenericDSP402 in the Input Assistant, click OK.

Connect the added input function block and the enable function block with wires.

Similarly, continue to add the relative movement function block MC_ MoveRelative, Stop function block MC_ Stop, Reset function block MC_Reset. The procedure is shown in the figure below.

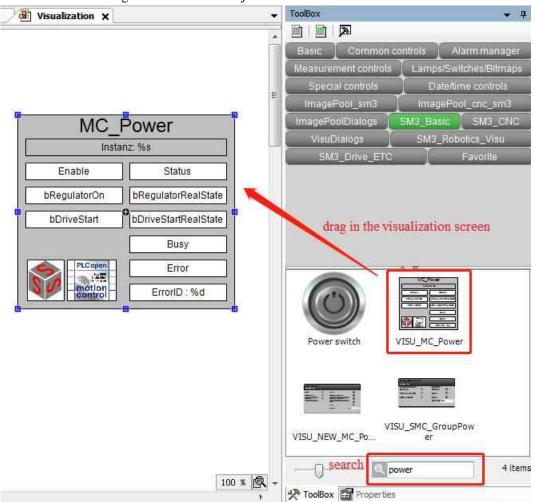

8) Add visualization

Right click application in the devices column and select Add object - visualization. After naming and selecting the programming method, click Add.

Application Appli	Application
Application Appli	Application
IDera & Cut POU Be Copy Paste Poete Refactoring XINUE DS Add Coject XINUE DS Add Folder Go SM SoftMotion Ge Logn Delete application from device Task Depi	Avis Group
Skatus	Data Sources Manager DUT DUT External File Global Vanable List Image Pool Image Pool Network Variable List (Receiver) Network Variable List (Sender)
	etus POU POU for implicit checks POU for implicit checks Recipe Manager
Polis	Redundancy Configuration Symbol Configuration Text List Trace Trace Trend recording manager Unit conversion
Messages-Total 0 error(s), 0 warning(s), 5 message(s)	

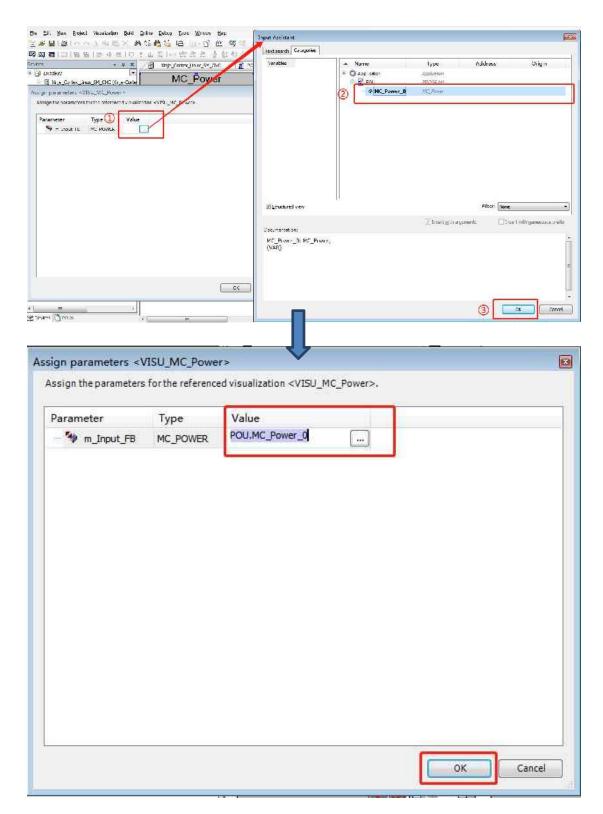

Visualization	naming	
Symbol libraries	Active	

Double click visualization in the devices column to add the required visualization. For example, you can search for power in the toolbar and drag the visualization object into the screen.

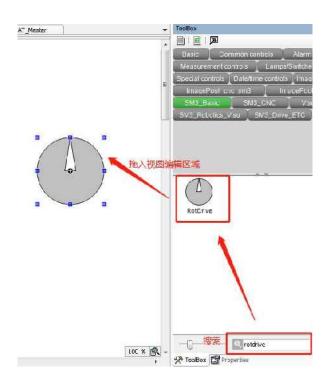

When you drag the control object into the editing area, the dialog box Assign parameters < VISU_MC_Power> will pop up automatically, link the control object to the corresponding declared variable. Double click the value column.

Click Click Click, at this time, select the declared variable in the newly pop-up dialog box, and then click OK. The linked variable name will appear in the value column. Finally, click OK, that is, the variable linking is completed. Similarly, other control object follow suit.

Add an object that simulates the rotation of the motor and link it to the motor axis. Add it in the same way as above.

The created view is as follows:

10) Online control

Parameter setting of axis. Double click axis 1 to set axis parameters in the Scaling/Mapping tab. (1) To set the encoder accuracy, a 19-bit encoder is connected in this example, so 524288 is filled in. The relationship between settings and output: coefficient =((4)*(5)*(6))/((2)*(3))

Example: when the input-output relationship coefficient is 10, the distance in the MC_MoveRelative function block is set to 100, then 100/10*524288 = 5242880, that is, the set operating distance is 5242880 pulses, and the motor will rotate for 10 polar distance.

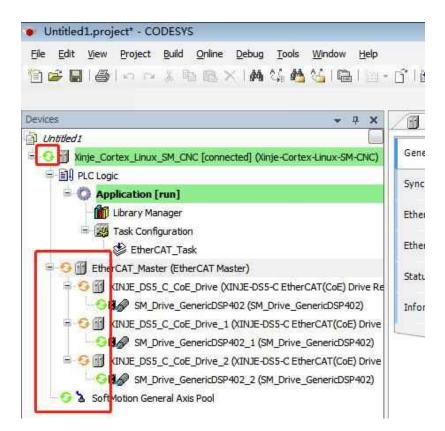

At this time, set the velocity value in the function block to 10, then $10/10^*$ 524288 = 524288, that is, the motor will run at the speed of 524288/s.

Set the acceleration value to 1000, then 1000/10*524288 = 52428800, that is, the acceleration of the motor is $52428800/s^2$, the deceleration setting is the same.

After setting parameters, compile the program for syntax check, and log in and run the program after no error is reported. Login enables the application to establish a connection with the target device and enter the online state. The precondition for correct login is to correctly configure the communication settings of the device and the application must be free of compilation errors.

Execute 🕮 compile, 🥵 login, ▶ run, the normal operation status is shown in the figure below:

At this time, the distance, speed and other parameters that the motor needs to move can be set in the visualization. Click bDriveStart—bRegulatorOn—Enable in turn in the MC_Power function block to enable the motor normally. Finally, click Execute in MC_MoveRelative function block to start relative position movement.

11.4 OMRON and DL6 servo Ethercat communication example

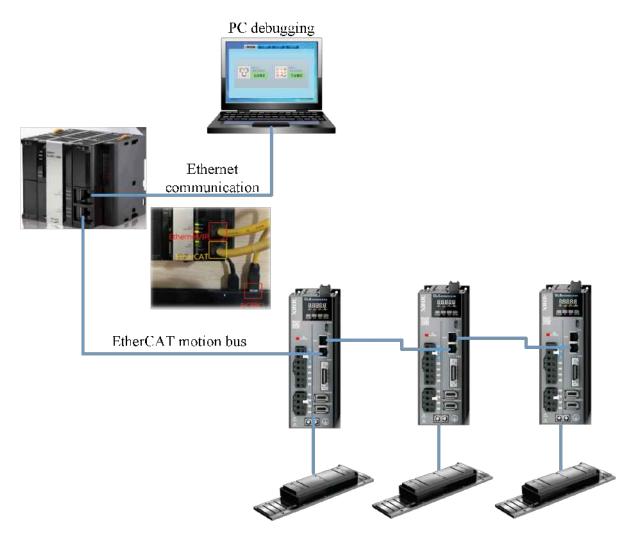

This example will explain how Omron PLC is used as EtherCAT master station and Xinje servo is used as slave station to realize EtherCAT motion control.

Note: This communication case takes DS5C1-20P7-PTA as an example, and the bus configuration of DL6-2003/2006 (- GS) is the same as DS5C1.

11.4.1 System configuration

Name	Model	Quantity	Note
Upper computer	Sysmac Studio	1	Omron software
Controller	OMRON NJ501-1500 series	1	
Xinje servo	DL6-2003(-GS)	1	
Network cable	JC-CA-3	Some	Used for connection between computer and PLC or between PLC and servo

11.4.2 System topology

The NJ501 CPU module has two network ports, the red marked is Ethernet/IP, which are used to connect the Omron host computer SYSMAC studio to monitor and write data to the PLC. The yellow marked is EtherCAT, and the other end is connected to Xinje DL6 series servo to realize EtherCAT communication.

Each network port is equipped with three indicators, RUN/ERROR/ACT. After the network cable is correctly connected, RUN should be on and ACT should be on. When the communication is established and there is data interaction at the network interface, ACT flashes. Error will not light up unless it is abnormal.

11.4.3 Debugging steps

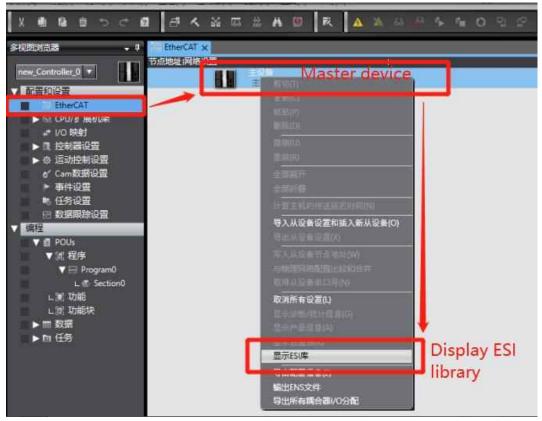

1)New project

If "new project" is selected for the first time, select model: NJ501-1500, version 1.02 in the project attribute interface, and click "create" to generate the programming interface.

Sysmac Studio						-	C
 高誌 ● 打开工程(O) ☆ 导入() ◇ 号九() ク 注接研发音(C) げ 可(L) 試用版 最余工数10 	New project	□ 工程属性 工程内容 作者 住母 光型 没無 版本	新設工作	I uste	• • •		

2)Add XML file

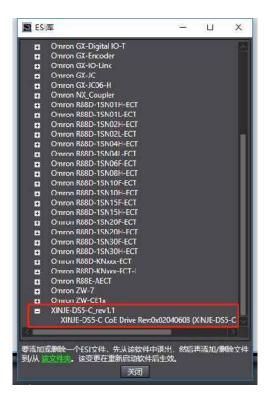

Double click "EtherCAT" on the main interface to call up the EtherCAT configuration interface. For the first time, you need to add XML files to the library. Right click "master device" and select "display ESI library".

Then we need to add the XML file of DL6 to the pop-up ESI library. Select "this folder" to display the path of the storage folder, and put the "XINJE-DL6-ECT(V1.2)" XML type file in the path folder.

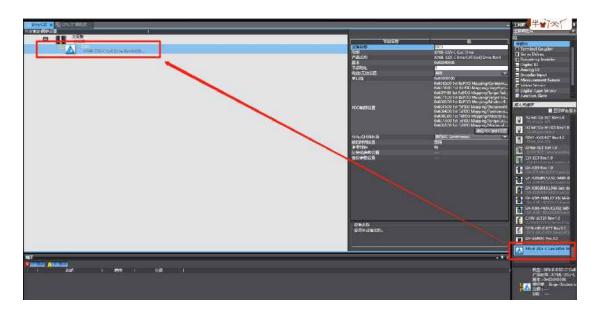

Finally, close SYSMAC studio and restart the software, browse the "ESI library" again, and the XINJE-DL6 slave station description file already exists in the library.

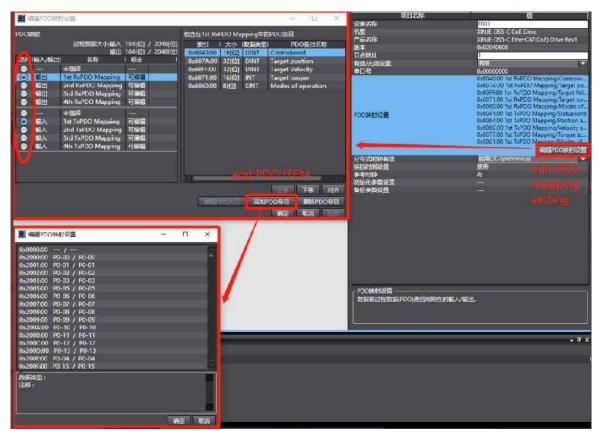

3)Add device

Find "XINJE-DL6 CoE Drive Rev" on the right side of the interface, double click it to add to the node under master device.

After adding a node, select the node with the cursor to display the PDO configuration of the current node. Select Edit PDO mapping settings. The pop-up interface will display the current output PDO mapping on the left and the PDO items on the right. You can add or delete PDO as required.

Select "add PDO item" to add PDO, and the pop-up window will show the PDO objects that can be added. After selecting, click "OK", and then click "apply", and the addition is successful.

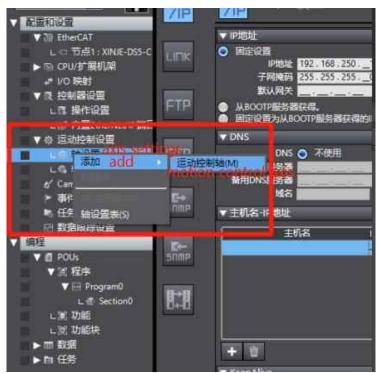

After adding, it is shown in the following figure:

PDO映	蚏				包含在1st Rx	PDO Ma	pping中的	IPDO条目

4)Motion control axis settings

Double click "motion control settings", right-click "axis settings", and select "add - motion control axis".

Double click " MC_Axis000" to display the axis setting interface. The interface is divided into multiple sub interfaces.

Select "axis type - servo axis" in the "axis basic settings" interface, and select "node 1: DL6" in the "input device".

Click detailed settings, expand the configuration module. The function name needs to be mapped to the PDO mapping item on the device. It needs to be added manually here. Missing or wrong addition will affect the subsequent use of this parameter.

In "unit conversion setting", the number of motor encoder lines is correctly filled in the "number of command pulses per motor revolution". If 19-bit encoder is used in this example, it is modified to 524288. "Working stroke of motor for one revolution" is the equivalent stroke of motor for one revolution. The example here is modified to 524288, and the default gear ratio is 1:1.

5)Write "round trip" program

Description of programming interface: select "programming / POUs / program / program0/ section0" and double-click "section0" to show the programming interface. By default, program0 is ladder programming. If ST programming is selected, right click "program / add / ST". The "toolbox" allows you to add various ladder elements.

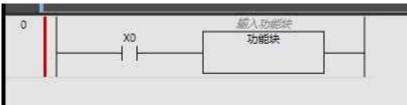

Select "contact" and drag it directly into the ladder node.

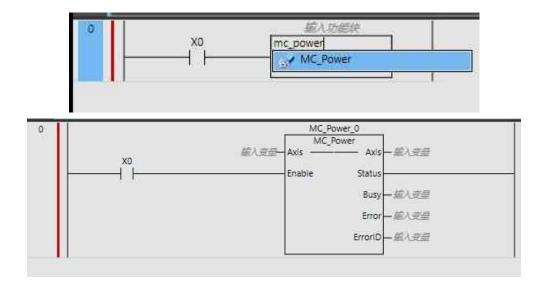

Click "input variable" to write the variable name. If it is a new variable name, a new variable will be generated. If it is an existing variable, you can directly select a variable to fill in. New variables can be viewed in the variable table. Right click variable X0 and select "jump to variable table" to expand the variable table. In the variable table, you can create variables of various data types for calling, or view all variables that have been defined.

部 X()	名称		始类型	初始但	I 分配到	(供待)		江科
ME	ower 0	BOOL MC Powe	ər					
							- 10	
0	,×0	5雪表(V)	-					
		辐数据类型(Y)						
		·转利变量表(V)						
			C.W.					
		私接点(向上)(
		《入接点(向下)()	M)					
		z薛(I)	2					
		_微分(U)						
		·微分(N) (加到敵分监视:						
			***, ¹⁴ 9					
	8	140(7) (利(1)						
		(B ;(D)						
	R	、转(G)						
	Ø	新点(R)						
	1	制刷新印						

Add a "function block" in the same way as in the ladder diagram.

Enter a function block name to call this function block parameter. If "MC_Power" is input, the calling function block is declared as MC_ Power.

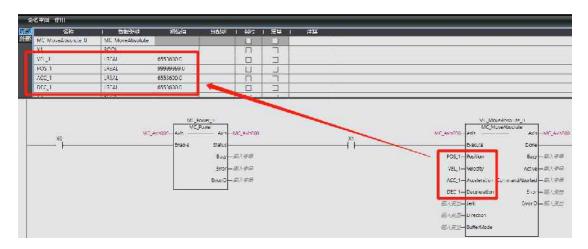

Function block "Axis" pin connected variable, input MC_Axis000 indicates that the function block is applied to the axis "MC Axis000".

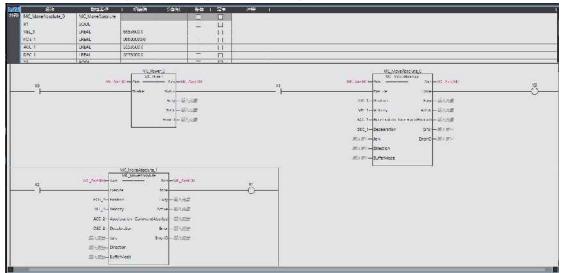

Add function block "MC_MoveAbsolute" in the same way, and define the variable name for the pins "Position""Velocity""Acceleration""Deceleration" to "Pos 1""Vel 1""Acc 1""Dec 1".

The defined variables can be written with initial values in the variable table, and the initial values take effect when the PLC is running.

The same way to write a complete round-trip motion ladder program.

6)Gateway communication settings

First, check the IP address of the PLC: in the multiview browser, select "controller settings - built-in Ethernet / IP port settings" to show the "TCP / IP settings" interface on the right. The fixed IP address setting of the current project can be viewed in the configuration interface. For a new program, the default IP address is 192.168.250.1.

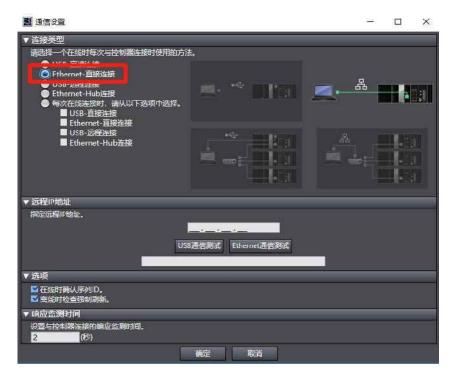

Communication configuration path: "controller - communication settings".

插入(I)	工程 P)	控制器(C)	模拟(S)	[1]具[7]	帮助(H)	-	
c 🖸		通信设置(0	.)				A #
		变更设备(\	0				
- 4	Section	在线(O)		Ctrl+\	N	is000 (이 전3
	变量	高钱(F)		Ctrl+S	hift+W		
	命名空	同步(M)		Ctrl+!	W.	_	_
	内部	传送中(A).			,	T	初始值
7	外部 MC	模式(M)			,		

Select "Ethernet - direct connection" in the "communication setting" interface, and then click "OK" to close the interface.

Note: Ethernet connection requires that the IP address of the connected device (PC) is automatically obtained or in the PLC IP address network segment. Therefore, before connecting, confirm whether the IP address setting of the PC meets the requirements.

7)Compile program and prepare connection

Find "compile controller" in the toolbar to compile the project. If there is any error, check the cause of the error.

	53 👬 👗 🚇	R 🔺 🔌	63 6 0 5	
	am0 🗙 😭 1/0 स्टिन	· 编译控制器(B)		
编译				
			Program0 Sectio 行1	位置
「「「「「「」」」、「「「」」」				

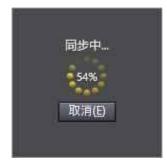

编译			
	说明	程序	
- 二、 編 注 (編 注)			

After the compilation is passed, find "online" in the toolbar and click it. If the pop-up window "failed to connect to the controller" appears, check whether the communication configuration is correct. After successful online, the upper computer switches to online status.

Select "synchronize" in the toolbar, and the pop-up window compares the local project with the project in the controller. The local project and the project in the controller display "out of sync". Click "transfer to controller" to download the local project and overwrite the original project of the controller.

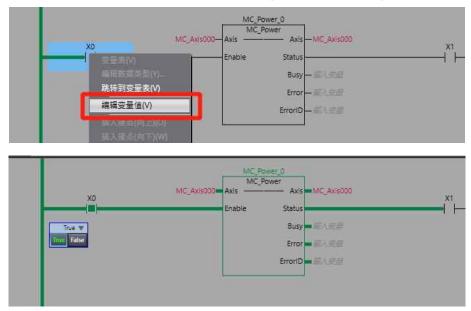

After synchronization, click "recompare" to view the synchronization items of each local project and the controller project. When the subsequent modified project is synchronized again, the different items from the controller project will be marked in detail.

8)Online control

On the "section0" interface, right-click the variable "X0", select "Edit variable value", switch BOOL to the state

"True", the function block "MC_Power" takes effect, and the servo enable is turned on. Change the state of the variable "X1" to "True" in the same way to realize the round-trip movement of the program.

PDO object data can be monitored by "IO mapping".

Appendix

Appendix 1 Driver parameters

Appendix 1.1 PX-XX

Modification and effective:

"o" means modifying when servo OFF and take effect at once.

" $\sqrt{}$ " means modifying anytime and take effect at once.

"•" means modifying when servo OFF and take effect when power on again.

" Δ " means modifying anytime and take effect when the motor doesn't rotate.

For parameters set in hexadecimal system, the prefix "n." is added to the setting value to indicate that the current setting value is hexadecimal number.

PX-XX=n. x x x x

 \rightarrow PX-XX.0 →PX-XX.1 →PX-XX.2 ▶ PX-XX.3

- The default values of linear motor parameters have no reference value. Please configure according to the actual motor parameters.
- The inverse time characteristic curve of overload alarm is recommended to be 115% (∞), 200% (10s), and 300% (3s) of the rated current.

Plan a curve according to the inverse time limit new curve, as shown in the following figure:

Status word(6041h)

The commands for PDS state migration and control of the slave station are set through 6040h (control word).

Index	Sub	Name	Range	Data type	Accessibility	PDO	Suitable
	index						mode
6041h	00h	Statusword	0~65535	U16	ro	TxPDO	ALL

6041h bit information :

Bit	Nai	me	Note
0	ready to switch on	Main circuit power off status	-
1	switched on	Servo ready status	-
2	operation enabled	Servo running	-
3	fault	Fault	-
4	Main circuit power on		1: Indicates that the power supply voltage is
4	voltage enabled	status	printed onto the PDS
5	quick stop	quick stop	0: Indicates that PDS receives a quick stop request. The bit logic of quick stop is valid at 0. Please note to execute other bit logic and reverse actions
6	switch on disabled	Servo cannot run	-
7	warning	warning	1: Indicates that a warning is occurring. When warned, the PDS status remains unchanged and the motor continues to operate.

Bit	Nai	ne	Note
8	reserved	reserved	-
			0: Indicates that 6040h is in an unprocessed
			state.
9	remote	Remote control	1: Indicates that 6040h is in a manageable
			state. The ESM state changes to 1 when
			transitioning above PreOP.
10	operation mode specific	Control mode	PP, PV, TQ, HM: target reached
10	operation mode specific	dependency bit	In other modes: this bit is undefined
		The internal position	The main reason for internal limitations is
11	internal limit active	of the software	that the bit11 of 6041h becomes 1 when it
		exceeds the limit	occurs
			PP: set-point acknowledge
			PV: speed
12	operation mode specific	Control mode	HM: homing attained
12	operation mode specific	dependency bit	CSP, CSV, CST : drive follows command
			value
			TQ: this bit no definition
			PP: following error
13	operation mode specific	Control mode	HM: homing error
15	operation mode specific	dependency bit	CSP: following error
			In other modes: this bit is undefined
14~15	reserved	reserved	Value fixed to 0

6041h bit6~5, bit3~0 information:

Quick stop mode(605Ah)

Index	Sub index	Name	Unit	Range	Data type	Accessibility	PDO	Suitable mode
605Ah	00h	Quick stop option code	-	0~7	116	rw	NO	ALL

605Ah information:

Control mode	Value	Effective deceleration	PDS status after stop
	0 F		
pp, csp, csv, pv mode	1	6084h	Switch on disabled
	2	6085h	

Control mode	Value	Effective deceleration	PDS status after stop
	3	60C6h	
	5	6084h	
	6	6085h	Quick stop active
	7	60C6h	
	0	Free stop on servo side	
	1	609Ah	
	2	6085h	Switch on disabled
Hm mode	3	60C6h	
	5	609Ah	
	6	6085h	Quick stop active
	7	60C6h	
	0	Free stop on servo side	
	1, 2	6087h	Switch on disabled
cst, tq mode	3	Torque set to 0	
	5,6	6087h	Quick stop optive
	7	Torque set to 0	Quick stop active

Example of deceleration stop action based on Quick stop command:

A: If 6040h: bit2 (Controlword: quick stop) changes from 1 to 0, start decelerating stop.

The PDS status during deceleration changes to Quick stop active.

B: The motor stops when the actual speed is detected to be below 10r/min.

The PDS status after stopping is Switch on disabled or changed to Quick stop active.

Stop mode selection (605Bh)

Index	Sub	Name	Unit	Range	Data type	Accessibility	PDO	Suitable
	index							mode
605Bh	00h	Shutdown option code	I	0~1	I8	rw	RxPDO	ALL

605Bh information:

(1)When PDS command [Shutdown] is receiving

~ /		e	
Control mode	Value	Effective deceleration	PDS status after stop
0		Free stop on servo side	
pp, csp, csv, pv mode	1	6084h	
II	0	Free stop on servo side	Deady to gwitch an
Hm mode	1	609Ah	Ready to switch on
ast to made	0	Free stop on servo side	
cst, tq mode	1	6087h	

(2)When PDS command [Disable voltage] is receiving

Control mode	value	Effective deceleration	PDS status after stop
	0	Free stop on servo side	
pp, csp, csv, pv mode	1	6084h	
II 1	0	Free stop on servo side	Switch on disabled
Hm mode	1	609Ah	
cst, tq mode	0	Free stop on servo side	

1	6087h	
---	-------	--

An example of slowing down and stop based on the Shutdown command:

A: If you receive the PDS command "Shutdown" to start deceleration and stop.

The PDS status during deceleration remains Operation enabled.

B: The motor stops when the actual speed is detected to be below 10r/min.

The PDS status after stopping is Ready to switch on.

Servo OFF shutdown mode selection(605Ch)

Index	Sub	Name	Unit	Range	Data type	Accessibility	PDO	Suitable
	index							mode
605Ch	00h	Servo OFF shutdown	-	0~1	I8	rw	RxPDO	ALL
		mode						

605Ch information:

Current control mode	Value	Effective deceleration	PDS status after shutdown		
nn agn agu nu mada	0	Servo side free stop			
pp, csp, csv, pv mode	1	6084h			
Hm mode	0	Servo side free stop			
Him mode	1	609Ah	Switched on		
ast to made	0 Servo side free stop				
cst, tq mode	1	6087h			

An example of slowing down and stop based on the Disable operation command.

A: If you receive the PDS command "Disable operation", start deceleration and stop.

The PDS status during deceleration remains Operation enabled.

B: Motor stops when the actual speed is below 10 r/min.

The PDS status bit after stop is Switched on.

Pause shutdown mode selection(605Dh)

Index	Sub	Name	Unit	Range	Data type	Accessibility	PDO	Suitable
	index							mode
605Dh	00h	Pause shutdown mode	-	1~3	I16	rw	NO	ALL
005DI	0011	selection						

605Dh information:

Current control mode	Value	Effective deceleration	PDS status after shutdown			
	1 6084h					
pp, csp, csv, pv mode	2	6085h				
	3	6072h, 60C6h				
	1	609Ah	Operation enabled			
Hm mode	2	6085h	Operation enabled			
	3 6072h, 60C6h					
ast ta mada	1, 2	6087h				
cst, tq mode	3	Torque set to 0				

Examples of deceleration and stop based on the Halt function

A: If 6040h: bit8 (Controlword: halt) changes from 0 to 1, start decelerating and stop. The PDS status during

deceleration remains Operation enabled.

B: the motor stops when the actual speed is below 10 r/min. After stopping, the PDS status remains in Operation enabled.

Alarm shutdown mode selection(605Eh)

Index	Sub	Name	Unit	Range	Data type	Accessibility	PDO	Suitable
	index							mode
605El	00h	Fault reaction option code	-	0~2	I16	rw	NO	ALL

605Eh information:

(1)When EtherCAT communication association abnormal alarm occurs (E-800~E-899):

Current control mode	Value	Effective deceleration	PDS status after shutdown
	0	Servo side free stop	
pp, csp, csv, pv mode	1	6084h	
	2	6085h	
	0	Servo side free stop	Fault
Hm mode	1	609Ah	Fault
	2 6085h		
ast ta mada	0	Servo side free stop	
cst, tq mode	1, 2	6087h	

(2)When EtherCAT communication is not associated with abnormal alarms (not E-800~E-899):

Current control mode	Value	Effective deceleration	PDS status after shutdown
pp, csp, csv, pv	0, 2, 3	Servo side free stop	Fault
hm, cst, tq			

Examples of deceleration and stop based on alarms.

A: If an alarm occurs, start decelerating and stop. The PDS status during deceleration is Fault reaction active. B: the motor stops when the actual speed is below 10 r/min. The PDS status after stopping is Fault.

Control mode setting(6060h)

The control mode is set through 6060h.

Index	Sub	Name	Range	Data type	Accessibility	PDO	Suitable
	index						mode
6060h	00h	Mode of operation	-128~127	I8	rw	RxPDO	All

6060h bit information:

bit		Definition	abbr	correspond
-128~	-	Retain	-	-
-1				
0	No mode changed/No mode	No control mode change/No control mode	-	-
0	assigned	allocation		
1	Profile position mode	Contour position control mode	pp	YES
3	Profile velocity mode	Contour speed control mode	pv	YES
4	Torque profile mode	Contour torque control mode	tq	YES
6	Homing mode	Origin reset Position mode	hm	YES
8	Cyclic synchronous position	Periodic synchronous position control	csp	YES

	mode			mode		
9	Cyclic	synchronous	velocity	Periodic synchronous speed control mode	csv	YES
	mode					
10	Cyclic	synchronous	torque	Periodic synchronous torque control mode	cst	YES
	mode					
11~127	-			Retain	-	-

Since 6060h is the default = (no mode change/no mode assigned), be sure to set the control mode value used after power input. When the set value for 6060h is 0 and the set value for 6061h is 0, an E-881(Control Mode Set Exception Protection) occurs if the PDS state migrates to Operation enabled.

After the initial state is converted from 0 to the supported control mode (pp, pv, tq, hm, csp, csv, cst), set 6060h to 0 again, the previous control mode will be maintained as "No mode changed", and the switch of control mode cannot be performed.

Control mode display(6061h)

The confirmation of the internal control mode of the servo drive is performed according to 6061h. After setting 6060h, please confirm whether it is feasible to set this object action by detection.

Index	Sub	Name	Range	Data type	Accessibility	PDO	Suitable
	index						mode
6061h	00h	Mode of operation display	-128~127	I8	ro	TxPDO	All

Position trajectory planning type(6086h)

Index	Sub index	Name	Unit	Range	Data type	Accessibility	PDO	Suitable mode
6086h	00h	Motion profile type	-	-32768~32767	I16	ľW	RxPD O	НМ

This parameter 0: Step type; 1: Slope type.

This parameter is only applicable to HM mode. In PP and PV modes, slope types are directly used within trajectory planning.

In CSP and CSV modes, this parameter is not required and trajectory planning is completed at the main station.

Torque slope (6087h)

Index	Sub	Name	Unit	Range	Data	Access	PDO	Suitable		
	index				type	ibility		mode		
	00h	Torque clone	0.1%	0~4294967295	U32	rw	RxPDO	TQ		
6087h		Torque slope	0.170	0~4294907293				CST		
008711		Set the parameter values to give a bias torque command.								
		In CST mode, it is only	n CST mode, it is only effective in deceleration stop time.							

Torque planning type (6088h)

Index	Sub	Name	Unit	Range	Data	Accessi	PDO	Suitable
	index				type	bility		mode
6088h	00h	Torque planning type	-	0~65535	I16	rw	RxPDO	TQ

This parameter 0: Step type; 1: Slope type.

In TQ mode, the slope type directly used for torque planning, modifying this parameter has no effect.

Index	Sub	Name	Unit	Range	Data	Access	PDO	Suitable
	index				type	ibility		mode

Digital outputs(60FEh)

Index	Sub index	Name	Unit	Range	Data type	Accessibility	PDO	Suitable mode
	-	Digital outputs	-	-	-	-	-	-
60FEh	01h	Output of operating the external output signal	-	-	-	-	-	-
	02h	Set output operation host machine function of external output signal	-	-	-	-	-	-

60FEh bit information :

Index	Bit	Name	Value	Note
	0-15	Reserved	-	-
	10	16 Demote CO1 entropy states	0	Remote SO1 output signal not detected
	16	Remote SO1 output status	1	Remote SO1 output signal detected
01h	17	Remote SO2 eutrus status	0	Remote SO2 output signal not detected
	1/	Remote SO2 output status	1	Remote SO2 output signal detected
	18	8 Remote SO3 output status	0	Remote SO3 output signal not detected
			1	Remote SO3 output signal detected
	0-15	Reserved	-	-
	16	16 Demote SQ1 systems enable	0	Turn off remote SO1 output
	10	Keniole SOT output enable	Remote SO1 output enable 1 Turn on remote SO1 output	Turn on remote SO1 output
02h	17	17 Remote SO2 output enable —	0	Turn off remote SO2 output
	17		1	Turn on remote SO2 output
	10	Domoto SO2 output onoblo	0	Turn off remote SO3 output
	18	8 Remote SO3 output enable		Turn on remote SO3 output

Target velocity(60FFh)

Index	Sub index	Name	Unit	Range	Data type	Accessibility	PDO	Suitable mode
60FFh	00h	Target velocity	Command unit/s	-4294967296~4294967295	U32	RW	RxPDO	PV

Supported drive mode(6502h)

This servo driver can confirm the supported control mode based on 6502h.

Index	Sub index	Name	Unit	Range	Data type	Accessibility	PDO	Suitable mode
6502h	00h	Supported drive modes	-	-2147483648	I32	ro	TxP	ALL

~2147483647 DO

6502h bit information:

bit	Definition	abbr	Correspond
0	Profile position mode	рр	YES
2	Profile velocity mode	pv	YES
3	Torque profile mode	tq	YES
5	Homing mode	hm	YES
7	Cyclic synchronous position mode	csp	YES
8	Cyclic synchronous velocity mode	CSV	YES
9	Cyclic synchronous torque mode	cst	YES
10~31	-	-	-

Appendix	3	Glossary	of	Гerms	
11		J			

Abbreviation	Full name	Note
EtherCAT	Ethernet for Control Automation	Using Ethernet for communication functions
EulerCAT	Technology	in automation control technology
COE	CANopen Over EtherCAT	CAN Application Protocol Based on EtherCAT
FMMU	Fieldbus Memory Management Unit	Fieldbus Memory Management Unit
SM	Sync Manager	Sync Manager
pp	Profile position	Contour position control mode
pv	Profile velocity	Contour speed control mode
tq	Torque profile	Contour torque control mode
csp	Cyclic synchronous position mode	Cyclic position control mode
hm	Homing mode	Origin reset position control mode
CSV	Cyclic synchronous velocity mode	Cyclic speed control mode
cst	Cyclic synchronous torque mode	Cyclic torque control mode
DC	Distributed Clock	Distributed clock
SDO	Service Data Object	Service data object, used to transmit non periodic communication data
PDO	Process Data Object	Process data object, used to transmit periodic communication data
TxPDO	-	PDO transmitted from the station to the main station
RxPDO	-	PDO transmitted from the master station to the slave station
ESM	EtherCAT State Machine	EtherCAT state machine
ESC	EtherCAT Salve Controller	Slave station controller
	Physical layer device that converts data	Physical layer devices that convert data from
PHY	from the Ethernet controller to electric or	Ethernet controllers into electrical or optical
	optical signals.	signals
PDI	Process Data Interface or Physical Device Interface	Process data interface
EEPROM	Electrically Erasable Programmable Read Only Memory	Programmable read-only memory, a non-volatile memory used to store ESC configurations and device descriptions. Connect to ESI interface
ESI	EtherCAT Slave Information, stored in ESI EEPROM(formerly known as SII)	EtherCAT secondary information, stored in ESI EEPROM (formerly known as SII)

In TQ mode, the slope type directly used for torque planning does not work when modifying this parameter.
